

What is Economics All About ?

EE 211

- A set of principles for understanding the economics of how individuals make choices
 - A set of principles for understanding how individual choices interact
 - A set of principles for understanding economy-wide interactions
 - Explain the importance of scarcity, choice, and opportunity cost, and they are illustrated by the production possibilities boundary
 - Explain that all economies are mixed economies, having elements of free markets, tradition, and government intervention
-

- Distinguish between positive and normative statements in economics.
 - Explain how economists use models to help them think about the economy.
 - Describe the interaction between economic theories and empirical observation.
 - Describe several types of economic data, including time-series and cross-sectional data, and scatter diagrams.
-

- **Economics** is the social science that studies the production, distribution, and consumption of goods and services
 - A **market economy** is an economy in which decisions about production and consumption are made by individual producers and consumers
-

- In the famous passage on Adam Smith (1776) book “The Wealth of Nations” wrote about how individuals, in pursuing their own interests, often end up serving the interests of society as a whole. Of a businessman whose pursuit of profit makes the nation wealthier, Smith wrote: He intends only his own gain, and he is in this, as in many other cases, led by an invisible hand to promote an end which was no part of his intention.
 - An **invisible hand** refers to the way in which the individual pursuit of self-interest can lead to good results for society as a whole
-

Microeconomics (from Greek prefix *mikro-* meaning "small") is a branch of economics that studies the behavior of individuals and firms in making decisions regarding the allocation of limited resources.

Individual Choice

- is the decision by an individual of what to do, which necessarily involves a decision of what not to do
 - Basic principles behind the individual choices:
 - Resources are scarce
 - The real cost of something is what you must give up to get it
 - “How much?” is a decision at the margin
 - People usually take advantage of opportunities to make themselves better off
-

Scarcity, Choice, and Opportunity Cost

- Economics is the study of the use of scarce resources to satisfy unlimited human wants

Resources

- A society's resources are divided into land, labor, and capital
 - Economists refer to resources as factors of production
 - Outputs are goods (tangibles) or services (intangibles)
-

Resources are scarce

A **resource** is anything that can be used to produce something else

- Example Land, labor, capital

Resources are **scarce** – the quantity available isn't large enough to satisfy all productive uses

- Example Petroleum, lumber, intelligence, ...
-

The real cost of something is what you must give up to get it

- The real cost of an item is its **opportunity cost**: what you must give up in order to get it
 - Opportunity cost is crucial to understanding individual choice:
 - Example The cost of attending the economics class is what you must give up to be in the classroom during the lecture
 - Sleep? Watching TV? Rock climbing? Work?
 - *All* costs are ultimately opportunity costs
-

“How much?” is a decision at the margin

- You make a **trade-off** when you compare the costs with the benefits of doing something
 - Decisions about whether to do a bit more or a bit less of an activity are **marginal decisions**
-

Marginal Analysis

- Making trade-offs *at the margin*: comparing the costs and benefits of doing a little bit more of an activity versus doing a little bit less
 - The study of such decisions is known as **marginal analysis**
 - Example Hiring one more worker, studying one more hour, eating one more cookie, buying one more CD...
-

People usually take advantage of opportunities to make themselves better off

- An **incentive** is anything that offers rewards to people who change their behavior
 - Example Price of gasoline rises → people buy more fuel-efficient cars
 - There are more well-paid jobs available for college graduates with economics degrees → more students major in economics
 - People respond to these incentives
-

Interaction: How Economies work

Interaction: How Economies Work

Interaction of choices—my choices affect your choices, and vice versa

Principles that underlie the interaction of individual choices:

- There are gains from trade
 - Markets move toward equilibrium
 - Resources should be used as efficiently as possible to achieve society's goals
 - Markets usually lead to efficiency
 - When markets don't achieve efficiency, government intervention can improve society's welfare
-

There are gains from trade

- In a market economy, individuals engage in **trade**: They provide goods and services to others and receive goods and services in return
 - There are **gains from trade**: people can get more of what they want through trade than they could if they tried to be self-sufficient
-

The economy, as a whole, can produce more when each person specializes in a task and trades with others

©The New Yorker Collection 1991
Ed Frascino from cartoonbank.com.
All Rights Reserved.

“I hunt and she gathers – otherwise we couldn’t make ends meet.”

This increase in output is due to **specialization**: each person specializes in the task that he or she is good at performing.

Markets move toward equilibrium

- An economic situation is in **equilibrium** when no individual would be better off doing something different
 - Any time there is a change, the economy will move to a new equilibrium
 - Example what happens when a new checkout line opens at a busy supermarket?
-

Resources should be used as efficiently as possible to achieve society's goals

- An economy is **efficient** if it takes all opportunities to make some people better off without making other people worse off
- Should economic policy makers always strive to achieve economic efficiency?

Equity

- everyone gets his or her fair share
 - Since people can disagree about what's "fair," equity isn't as well-defined a concept as efficiency
-

Efficiency

- the resources are organized so as to produce the largest possible amount of the goods and services that people want to purchase
-

Efficiency vs. Equity

- Example Handicapped-designated parking spaces in a busy parking lot

A conflict between:

- **equity**, making life “fairer” for handicapped people, and
 - **efficiency**, making sure that all opportunities to make people better off have been fully exploited by never letting parking spaces go unused
-
- How far policy makers should go in promoting equity over efficiency?
-

Markets usually lead to efficiency

- The incentives built into a market economy already ensure that resources are usually put to good use
 - Opportunities to make people better off are not wasted
 - Exceptions: *market failure*, the individual pursuit of self-interest found in markets makes society worse off
 - the market outcome is inefficient
-

When markets don't achieve efficiency

- Why do markets fail?
 - Individual actions have *side effects* not taken into account by the market (externalities)
 - One party prevents mutually beneficial trades from occurring in the attempt to capture a greater share of resources for itself
 - Some goods cannot be efficiently management by markets
-

When market don't achieve efficiency, government can intervene to improve society's welfare.

E.g. The nature of the market failure caused by traffic congestion → commuters driving to work have no incentive to take into account the cost that their actions inflict on other drivers in the form of increased traffic congestion

Possible remedies to this situation include charging tolls, subsidizing the cost of public transportation, and taxing gasoline sales to individual drivers.

Economy - Wide interactions

→ One person's spending is another person's income

→ Overall spending sometimes gets out of line with the Economy's Productive Capacity; when it does,

Government Policy Can Change Spending

When the economy experiences either shortfalls in spending or excesses in spending, government policies can be used to address the imbalances

→ Increases in the Economy's Potential lead to Economic Growth Over time.

Economic Models: Trade-offs and Trade

- A **model** is a simplified representation of a real situation that is used to better understand real-life situations
- The **other things equal assumption** means that all other relevant factors remain unchanged

"Ceteris Paribus"

Trade-offs: The Production Possibility Frontier

- To illustrate the trade-offs facing an economy that produces only two goods
 - To show the maximum quantity of one good that can be produced for any given production of the other
 - To improve our understanding of trade-offs by considering a simplified economy that produces only two goods by showing this trade-off graphically
-

The Production Possibility Frontier

Quantity of coconuts

Point A 15 coconuts and 20 fish
Point B 9 " " 28 fish

- Economy is **efficient** if there are **no missed opportunities**-there is no way to produce more of one good without producing less of other goods
 - There is no way to produce more of one good without producing less of other goods
 - The efficiency for the economy as a whole requires both **efficiency in production** and **efficiency in allocation**: to be efficient, an economy must produce as much of each of other goods, and it must also produce the mix of goods that people want to consume
-

Opportunity cost

- E.g. Tom decides to go from point A to point B, he will produce 8 more fish but 6 fewer coconuts. So the opportunity cost of those 8 fish is the 6 coconuts not gathered
 - Since 8 extra fish have an opportunity cost of 6 coconuts, each 1 fish has an opportunity cost of $6/8 = 3/4$ of a coconut
 - We assume that the opportunity cost of an additional unit of a good doesn't change regardless of the output mix, the production possibility frontier is a straight line
-

Increasing Opportunity Cost

Quantity of coconuts

The more fish it produces, the more costly it is to produce another fish in terms of forgone production of a coconut.

And the same holds true in reverse:

The more coconut produces, the more costly it is to produce another coconut in terms of forgone production of fish.

E.g. to go from producing zero fish to producing 20 fish, they have to forgo producing 5 coconuts. That is, the opportunity cost of those 20 fish is 5 coconuts.

But to increase its production of fish to 40 - that is, to produce an additional 20 fish - it must forgo producing 25 coconuts a much higher opportunity cost.

When opportunity costs are increasing rather than constant the production possibility frontier is a bowed-out curve rather than a straight line.

A Production Possibilities Boundary

Economic Growth

Quantity of coconuts

What can lead the PPF to shift outward?

→ increase in the economy's factors of production

→ progress in technology

The Effect of Economic Growth on the Production Possibilities Boundary

Comparative Advantage and Gains from Trade

Production Possibilities for Two Castaways

(a) Tom's Production Possibilities

Quantity of coconuts

Production Possibilities for Two Castaways

(a) Hank's Production Possibilities

Tom and Hank's Opportunity Costs

	Tom's Opportunity Cost	Hank's Opportunity Cost
One fish	3/4 coconut	2 coconuts
One coconut	4/3 fish	1/2 fish

Specialize and Trade

- Both castaways are better off when they each specialize in what they are good at and trade
 - It's a good idea for Tom to catch the fish for both of them, because his opportunity cost of a fish in terms of coconuts not gathered is only $\frac{3}{4}$ of a coconut, versus 2 coconuts for Hank
 - Correspondingly, it's a good idea for Hank to gather coconuts for the both of them
-

How the Castaways Gain from Trade

How the Castaways Gain from Trade

		Without Trade		With Trade		Gains from Trade
		Production	Consumption	Production	Consumption	
Tom	Fish	28	28	40	30	+2
	Coconuts	9	9	0	10	+1
Hank	Fish	6	6	0	10	+4
	Coconuts	8	8	20	10	+2

Both Tom and Hank experience gains from trade:

- Tom's consumption of fish increases by two, and his consumption of coconuts increases by one.
 - Hank's consumption of fish increases by four, and his consumption of coconuts increases by two.
-

Tom and Hank will be willing to trade only if the "price" of the good each individual/country obtains in the trade is less than its own opportunity cost of producing the good.

This is a general statement that is true whenever two parties - countries, firms, or individuals trade voluntarily.

Example: Trade
10 coconuts for 10 fish

1 coconut = 1 fish

1 fish = 1 coconuts

Tom and Hank's opportunity costs

	Tom's opportunity cost	Hank's opportunity cost
one fish	$\frac{3}{4}$ coconut	2 coconuts
one coconut	$\frac{4}{3}$ fish	$\frac{1}{2}$ fish

Comparative Advantage and Gains from Trade

(a) Tom's Production and Consumption

(b) Hank's Production and Consumption

Comparative vs. absolute advantage

- An individual has a **comparative advantage** in producing a good or service if the opportunity cost of producing the good is lower for that individual than for other people
 - An individual has an **absolute advantage** in an activity if he or she can do it better than other people. Having an absolute advantage is not the same thing as having a comparative advantage
-

Tom vs. Hank – Absolute vs. Comparative

- Tom has an **absolute advantage** in both activities: he can produce more output with a given amount of input (in this case, his time) than Hank
- But we've just seen that Tom can indeed benefit from a deal with Hank because **comparative, not absolute**, advantage is the basis for mutual gain
- So Hank, despite his absolute disadvantage, even in coconuts, has a comparative advantage in coconut gathering
- Meanwhile Tom, who can use his time better by catching fish, has a comparative disadvantage in coconut-gathering

Comparative Advantage and International Trade

(a) The U.S. Production Possibilities Frontier (b) Canadian Production Possibilities Frontier

Class activity 😊

U.S. and Canadian's opportunity costs

	U.S.	Canadian
one million ton of pork		
one aircraft		

What countries have comparative advantage in which product?

Class activity 😊

U.S. and Canadian's opportunity costs

	U.S.	Canadian
one million ton of pork	$\frac{1500}{3} = 500$	$\frac{3000}{1.5} = 2000$
one aircraft	$\frac{3}{1500} = \frac{1}{500}$	$\frac{1.5}{3000} = \frac{1}{2000}$

Comparative Advantage and International Trade

- The US and Canada can both achieve mutual gains from trade
 - If the US concentrates on *producing pork* and ships some of its output to Canada, while Canada concentrates on *aircraft and ships* some of its output to the US, both countries can consume more than if they insisted on being self-sufficient
-

Transactions: The Circular-Flow Diagram

- Trade takes the form of **barter** when people directly exchange goods or services that they have for goods or services that they want
 - The **circular-flow diagram** is a model that represents the transactions in an economy by flows around a circle
-

The Circular-Flow Diagram

Circular-Flow of Economic Activities

- A **household** is a person or a group of people that share their income
 - A **firm** is an organization that produces goods and services for sale
 - Firms sell goods and services that they produce to households in **markets for goods and services**
 - Firms buy the resources they need to produce—**factors of production**—in **factor markets**
-

The Circular Flow

Individuals own factors of production. They sell the services of these factors to producers in factor markets and receive payment in return

- The payment becomes their (factor) incomes

Producers transform factor services into goods and services, which they then sell to individuals in goods markets, receiving payment in return

- The payment becomes the incomes of producers
-

How are Decisions Made?

Maximizing Decisions

- People are maximizers
- Consumers maximize utility, producers maximize profits

Marginal Decisions

- All decisions are based on weighing marginal cost against marginal benefit
-

The Complexity of Production

Production usually displays two characteristics noted long ago by Adam Smith: specialization and the division of labor

Specialization is the allocation of different jobs to different people. It is more efficient than self-sufficiency because:

- Individual abilities differ -- comparative advantage
- Focusing on one activity leads to improvements -- learning by doing

Division of labor extends the idea of specialization for the production of a single good or service

Markets and Money

Specialization must be accompanied by trade

Money eliminates the cumbersome system of barter by separating the transactions involved in the exchange of products, thereby facilitating specialization and trade

Is There an Alternative to the Market Economy?

Types of Economic Systems

- Traditional
- Command
- Free-Market

In practice, every economy is a mixed economy, in the sense some decisions are made by firms and households and some by the government

Government in the Modern Mixed Economy

Key government-provided institutions in market economies are private property and freedom of contract

Governments also intervene to:

- correct market failures
- provide public goods
- offset the effects of externalities

Markets often work well, but sometimes government policy can improve the outcome for society as a whole

Positive vs. Normative

Normative statements depend on value judgments and opinions -- cannot be settled by recourse to facts

Positive statements do not involve value judgements

They are statements about what is, was, or will be

Positive and Normative Statements

Positive

- A Raising interest rates encourages people to save.
- B High rates of income tax encourage people to evade paying taxes.
- C Lowering the price of tobacco leads people to smoke less.
- D The majority of the population would prefer a policy that reduced unemployment to one that reduced inflation.

Normative

- E People should be encouraged to save.
- F Governments should arrange taxes so that people cannot avoid paying them.
- G The government should raise the tax on tobacco to discourage people from smoking.
- H The government ought to be more concerned with reducing unemployment than inflation.

Which of the following is a positive statement?
Which is a normative statement?

A. Society should take measures to prevent people from engaging in dangerous personal behavior.

B. People who engage in dangerous behavior impose higher costs on society through higher medical costs

Economic theories

A theory consists of:

- a set of definitions about variables
 - endogenous and exogenous variables
 - a set of assumptions
 - motives, physical relations, direction of causation, conditions of application
 - a set of predictions (or hypotheses)
-

Endogenous variable

- A variable that is explained within a theory
- Dependent variable (y)

Exogenous variable

- A variable that is determined outside the theory
 - Independent variable (x)
-

Models

- as a synonym for a theory
 - as a specific quantitative formulation of a theory
 - as a specific application of a general theory
 - as an illustrative abstraction which helps to understand key features of a complex world
-

Testing theories

Rejection Versus Confirmation

A hypothesis can be tested and may be rejected by the data. This rejection brings the value of the theory into question

An alternative is to search for confirming evidence for a theory

But no matter how unlikely the theory is, some confirming evidence can generally be found

Statistical Analysis

Statistical analysis is used to test a hypothesis such as “if X increases, then Y will also increase”

Economists are compelled to use millions of “uncontrolled” experiments that are going on every day in the economy

These activities can be observed and recorded continuously, producing a mass of data

The analysis of such data requires the use of appropriate -- and often quite complex -- statistical techniques

Correlation Versus Causation

Positive correlation means only that X and Y move together

Negative correlation means that X and Y move in opposite directions

But X and Y may not be causally related. Or they may be related in the opposite way to what is expected -- reverse causality

Most economic predictions attempt to establish causality

Statistical tests often attempt to distinguish between correlation and causality

The Interaction Between Theory and Empirical Observation

Graphing economic theories

A functional relation can be expressed:

- in a verbal statement
 - in a numerical schedule (a table)
 - in a mathematical equation
 - in a graph
-

Functions

Consider a relationship between a household's annual income, Y , and its total consumption, C .

$$C = f(Y)$$

“ C is a function of Y ”

“the amount of consumption expenditure depends upon the household's income.”

Graphing Functional Relations

The relationship between two variables may be positive or negative.

If the graphs of these relationships are straight lines, the variables are linearly related to each other.

Otherwise, variables are said to be non-linearly related.

Two variable graphs

The slope of a Linear Curve

Example

Linear Pollution Reduction

- Let X be the variable measured on the horizontal axis and Y be the variable measured on the vertical axis.
- The slope of a straight line is then $\Delta Y / \Delta X$.

The Slope of a nonlinear curve

(a) Positive Increasing Slope

(b) Positive Decreasing Slope

(c) Negative Increasing Slope

(d) Negative Decreasing Slope

Calculating the slope along a nonlinear curve

- The Arc Method of calculating the slope
 - The Point Method of calculating the slope
-

The Point Method of calculating the slope

Maximum and Minimum points

Economic data

Economic variables usually come in two basic forms:

- Cross-sectional data
- Time-series data

A scatter diagram is a useful and common way of looking at the relationship between two variables
