

Comment on classmate seminar paper

The seminar that I would like to review is **“The influential in becoming an Esports athletes”** by **Kat Suchanya Kongcharoon**. The author wants to study which environment have effect to people that make people have more chance to be Esport athletes. The author separates into 3 main types which are demographic, influence, and personal traits. The method that the author uses to analyze is Probit regression analysis by collected the data by launch her questionnaire. So, the data is cross-sectional data. In the regression model there are 3 main categories consist of demographic variables, influence variables, and personal traits variables. After she drops demographic variables, and personal traits variables because research question that she would like to know how influence in family and friend. The results are financial status have influence to be athletes Esport by higher income of family is higher chance to be athletes Esport, family support have influence to be athletes Esport by family have a positive view toward games, friend factor have influence to be athletes Esport by there is interesting in games among friend.

After I have walkthrough her presentation and results, The result is not follow as my expectation such as risk factor that people are risk lover, risk neutral, or risk averse before I watched it I thought that risk factor have influence on who will be Esport athletes but the results show that risk factor is not relevant to Esport athletes. Moreover, another one factor that have to drop off is famous seeking factor which is whoever would like to be Esport athletes to acquire more fame to themselves which is not relevant to Esport athletes.
