

Building the Lower Sesan 2 Dam cut the mekong River destroy both economic and environment which have effect in many ways.

the very first problem is that when constructing dam, water in that area has been contaminated, affect the ecosystem such as migration and reproduction of fish species.

Once fishes can not travel through the Lower Sesan 2 Dam as usual, Local people in that area begin to face the affect from that problem such as amount of fishes being caught a days is calculated to be only 5 percent before the dam was constructed

Another environmental problem is insufficient amount of water for daily usage. As the dam affect the water flows, the land in that local area has been flooded which mainly effect their food supply and income.

In economics view. Eventhough they have been offer 6000 USD to build they new homes, These amount of money are not the same value as what they have lost. Also if they move out, they did not have skills to make enough income that serves their living.

The construction also lead to argrument that is it worth it or not. Because not only that this effect the living of local peoples but this also effect the environment. The construction create more carbon footprint due to loss of vegetation and land which economists seem that its create bad effect more than advantage.
