5 Exponential and Logarithmic Functions

5.1 *Exponential Functions (Revision)*

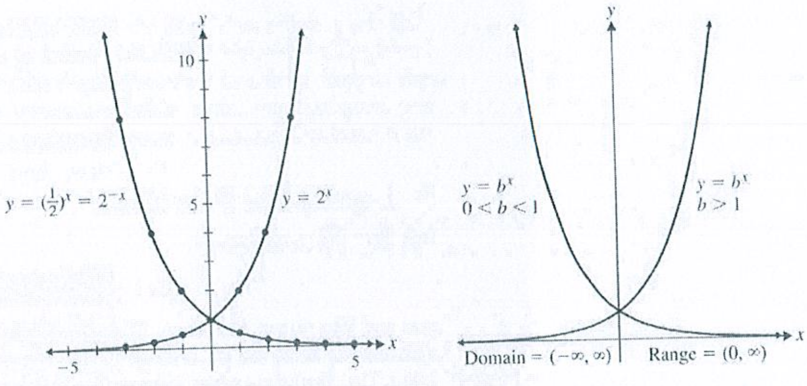
Exponential functions are used extensively in modelling and solving a while variety of real-world problems, including growth of money in compound interest; growth of populations of people, animals, and bacteria; radioactive decay; and learning associated with new technology e.g. computing and manufacturing technology.

5.1.1 General form:

$$y = f(x) = b^x \qquad b > 0, b \neq 1$$

Domain is ___R___ and range is ___R^+___.

b is positive to avoid complex (imaginary) number.



(A) (B)

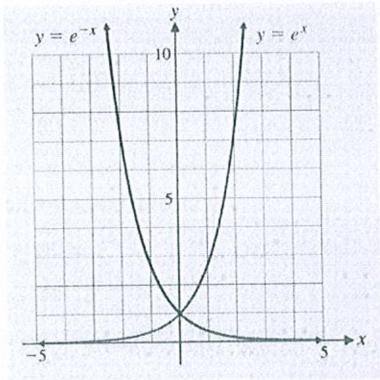
important features of exponential function

typical graph shape (The shape depends on values of b)

- All graphs will pass through the point (0, 1).
- All graphs are continuous.
- The x axis is a horizontal asymptote.
- If $b > 1$, then b^x increases as x increases.
- If $0 < b < 1$, then b^x decreases as x decreases.

5.1.2 Base e Exponential Function

$$e = 2.718\,281\,828\,459\ldots$$



$\rightsquigarrow$ similar to graphs of $y = b^x$
again the shape depends on value of b, in this case for $y = e^{-x}$
$\Rightarrow y = \left(\frac{1}{e}\right)^x$
$\therefore b = \frac{1}{e}$ which is < 1

On the other hand, $y = e^x$
$b = e > 1$

5.1.3 Exponential Properties

If n and m are positive integers,

→ please learn this!!

$$b^{n/m} = \left(\sqrt[m]{b}\right)^n = \sqrt[m]{b^n}$$

where $\sqrt[m]{b}$ denotes the positive mth root

$$b^{-n} = \frac{1}{b^n}$$

$$b^0 = 1$$

$$b^x = b^y \text{ if and only if } x = y$$

$$b^m b^n = b^{m+n}$$

$$\left(b^n\right)^m = b^{mn}$$

$$(ab)^m = a^m b^m$$

$$\left(\frac{a}{b}\right)^m = \frac{a^m}{b^m}$$

$$\frac{a^m}{a^n} = a^{m-n} = \frac{1}{a^{n-m}}$$

5.2 *Logarithmic Functions (Revision)*

inverse ⇒ in exponential function e.g.
$y = 2^x$ $(b=2)$
when $x=1$, $y=2$
This means for $y = \log_2 x$
when $x=2$, $y=1$

Logarithmic function is inversed of exponential function.

5.2.1 General form:

$y = \log_b x$ *where* $x = b^y, b > 0, b \neq 1$

Domain is R^+ and range is R.

* Note that Domain of log = Range of exponential
Range Domain

Note that y of log functions = x of exponential and x of log = y of exponential

Note that $\log_b 1 = 0$. If the base b is 10, it is normally omitted. The natural logarithmic of x, $\ln(x)$ is $\log_e(x)$. (natural log ∵ find in real life examples often)

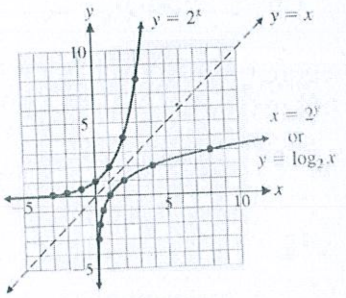


FIGURE 2

Exponential Function		Logarithmic Function	
x	$y = 2^x$	$x = 2^y$	y
-3	$\frac{1}{8}$	$\frac{1}{8}$	-3
-2	$\frac{1}{4}$	$\frac{1}{4}$	-2
-1	$\frac{1}{2}$	$\frac{1}{2}$	-1
0	1	1	0
1	2	2	1
2	4	4	2
3	8	8	3

Ordered pairs reversed

↳ note the shape $y = \log_2 x$ is symmetrical with $y = 2^x$ with the line $y=x$ as axis of symmetrical

5.2.2 Logarithmic Properties (b > 0 and $b \neq 1$, u and v are also positive numbers)

$\log_b 1 = 0$ and $\log_b b = 1$

$\log_b u = \log_b v$ if and only if $u = v$

$\log_b (uv) = \log_b u + \log_b v$

$\log_b \left(\frac{u}{v}\right) = \log_b u - \log_b v$

* $\log_b u^r = r \log_b u$

* $\log_b b^u = u$

* $\log_b x = \frac{\ln x}{\ln b}$

learn this !!

* use often in differentiation & integration of log functions

5.3 *Differentiation of Logarithmic and Exponential Functions*

I'll give these in exam but you have to learn how to use these

1 $\dfrac{d}{dx}\left(e^x\right)=e^x$	2 $\dfrac{d}{dx}\left(e^u\right)=e^u\dfrac{du}{dx}$
3 $\dfrac{d}{dx}(\ln x)=\dfrac{1}{x}$	4 $\dfrac{d}{dx}(\ln u)=\dfrac{1}{u}\dfrac{du}{dx}$

Ex. 1: Find the derivative of the following functions. (solution in separate files)

(a) $y=2e^x$ Ans: $y'=2e^x$

(b) $y=2e^{3x}$ Ans: $y'=6e^{3x}$

(c) $y=ae^{-bt}$ Ans: $y'=-abe^{-bt}$

(d) $y=5e^{x^4+2x}$ Ans: $y'=5(4x^3+2)e^{x^4+2x}$

(e) $y=\dfrac{e^{-3x}}{x^2+1}$ Ans: $y'=e^{-3x}\left[\dfrac{-3x^2-2x-3}{\left(x^2+1\right)^2}\right]$

Ex.2: Show that the derivative of $f(x)=xe^{2x}$ is $f'(x)=(2x+1)e^{2x}$. In addition, find the largest and the smallest values of the function $f(x)=xe^{2x}$ on the interval $-1\le x\le 1$.

Ans: Minimum $f\left(-\dfrac{1}{2}\right)\approx -0.184$ and maximum $f(1)\approx 7.389$ (solution in separate file)

Ex. 3: Find the derivative of the following functions. (solution in separate file)

(a) $y=5\ln x$ Ans: $y'=\dfrac{5}{x}$

(b) $y=\ln(5x)$ Ans: $y'=\dfrac{1}{x}$

(c) $y=x\ln x$ Ans: $y'=1+\ln x$

(d) $y=\dfrac{\ln\sqrt[3]{x^2}}{x^4}$ Ans: $y'=\dfrac{2}{3}\left[\dfrac{1-4\ln x}{x^5}\right]$

(e) $y=3\ln(x^2-5x)$ Ans: $y'=\dfrac{3(2x-5)}{x^2-5x}$

(f) $y=(x+\ln x)^{\frac{3}{2}}$ Ans: $y'=\dfrac{3}{2}(x+\ln x)^{\frac{1}{2}}\left(1+\dfrac{1}{x}\right)$

(g) $y=\log_b x$ Ans: $y'=\dfrac{1}{(\ln b)x}$

(h) $y=\log_b u$ (u is a function of x) Ans: $y'=\dfrac{1}{(\ln b)u}\cdot\dfrac{du}{dx}$

Generalised Derivative of Logarithmic Functions

not given in exam $\Rightarrow$ $\boxed{\dfrac{d}{dx}(\log_b u)=\dfrac{1}{(\ln b)u}\cdot\dfrac{du}{dx}}$ proof $\Rightarrow$ $\dfrac{d}{dx}(\log_b u)=\dfrac{d}{dx}\left[\dfrac{\ln u}{\ln b}\right]=\dfrac{1}{\ln b}\dfrac{d\ln u}{dx}$

$=\dfrac{1}{\ln b}\cdot\dfrac{1}{u}\dfrac{du}{dx}$

$\therefore$ This expression is useful but if you don't remember you can derive it!!

Ex. 4: Show that the derivative of $f(x)=x-\ln\sqrt{x}$ is $f'(x)=1-\dfrac{1}{2x}$. In addition, show that an equation for the tangent line to the graph of $f(x)=x-\ln\sqrt{x}$ at the point where $x=1$ is $y=0.5x+0.5$.

Derivative of Exponential Functions to the Base 'a' (a is a real number)

We can use the formula for the derivatives of e^u to differentiate a more general exponential function a^u. Replacing a with its equivalent from $e^{\ln a}$. $\left[a=e^{\ln a}\right]$

This substitution is useful in differentiation of a function in power form e.g. $y=a^u$ where a is a constant

$$\frac{d(a^u)}{dx}=\frac{d}{dx}\left[\left(e^{\ln a}\right)^u\right]$$

$$=\frac{d}{dx}\left(e^{u\ln a}\right)$$

$$=e^{u\ln a}\frac{d}{dx}(u\ln a)$$

$$=e^{u\ln a}\left(\frac{du}{dx}\right)(\ln a)$$

not given in exam $\Rightarrow$ $\boxed{\dfrac{d(a^u)}{dx}=a^u\ln a\left(\dfrac{du}{dx}\right)}$

both of these expressions will not be given in exam so I do not expect students to remember them. What I expect you to understand is that if you have to diff a log function, you will have to try to change it into ln form. Similarly, when you have to diff a power function a^u, you will have to change $a=e^{\ln a}$

This example will help you understand how to diff a power function by substitute

Ex. 4: Determine the derivative of the following functions.

$a = e^{\ln a}$ where a is constant

(a) $y = a^x$. Ans: $y' = a^x \ln a$

(b) $y = 20^x$ Ans: $y' = 20^x \ln 20$

(c) $y = x2^{3x}$ Ans: $y' = 2^{3x}(1 + 3x\ln 2)$

(d) $y = \alpha 10^{-x} + \beta 10^{-x^2}$ Ans: $y' = -\ln 10\left(\alpha 10^{-x} + 2\beta x 10^{-x^2}\right)$

(complete solution in separate file)

5.4 Logarithmic Differentiation

Technique of substitute $a = e^{\ln a}$

This technique is often useful to simplify the differentiation of $y = f(x)$ when $f(x)$ involves products, quotients or powers.

Ex. 5: Show that the derivative of $y = 2^x$ is $y' = (\ln 2)2^x$.

Ex. 6: Show that the derivative of $y = (x+1)^2(x+2)$ is $y' = (x+1)(3x+5)$.

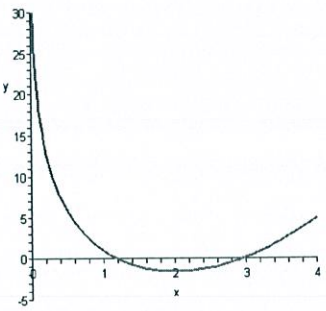
Ex. 7: Show that the derivative of $y = x^{2x+1}$ is $y' = x^{2x+1}\left[2\ln x + \dfrac{2x+1}{x}\right]$.

Try Ex 5,6,7, you'll see that substitute $a = e^{\ln a}$ is most useful when you have to diff a function in power form where the power contains variables such as x in Ex 5 and $2x+1$ in Ex. 7

5.5 Curve Sketching

Not in exam but give Ex. 8 as a homework !! (given marks)

Ex. 8: $f(x) = x^2 - 8\ln x$ intercepts the x axis at $x \approx 1.2$ and $x \approx 2.9$. Sketch the graph of $f(x) = x^2 - 8\ln x$.



Ans: Domain is positive real number.

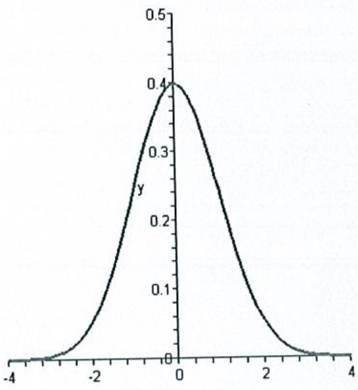
$$f'(x) = \frac{2x^2 - 8}{x}$$

$f(x)$ is decreasing between (0,2) and is increasing between $(2, \infty)$. The minimum point is (2,-1.5). The function is always concave up and there is no inflection point. $x = 0$ is the vertical asymptote and there is no horizontal asymptote.

Ex. 9: Determine where the function

$$f(x) = \frac{1}{\sqrt{2\pi}} e^{-\frac{x^2}{2}}$$

is increasing and decreasing, and where its graph is concave up and concave down. Find the relative extrema and inflection points and draw the graph.



Ans: $f'(x) = \frac{-x}{\sqrt{2\pi}} e^{-\frac{x^2}{2}}$,

$f''(x) = \frac{-x}{\sqrt{2\pi}} (x^2 - 1) e^{-\frac{x^2}{2}}$ (0, 0.4) is the relative maximum. (1, 0.24) and (-1, 0.24) are inflection points. The function is increasing for negative x and decreasing for positive x. The function is concave up where $x < -1$ and $x > 1$; and concave down where $-1 < x < 1$. There is no x intercept. $y = 0$ is the horizontal asymptote.
