Problem Sets 7 : Theory of Financial Intermediation

Please submit at the BE office, 5th floor department of Economics building.

Deadline of submission: November 24, 2015 before 15.00 hrs.

Late submission will not be accepted.

1. Financial Intermediation as Delegated Monitoring in Diamond (1996)

- Consider an economy in which n identical firms seek to finance projects.
- Each entrepreneur owns a firm and each firm requires an investment of $m = 100$ units of capital.
- The returns of each firm are identically independently distributed.
- Each entrepreneur does not have any initial funds. They have to borrow from lenders.
- The total number of lenders is $100n$, each lender owns 1 unit of capital to lend out.
- The project's realized value is a random variable with realization denoted by Y . $Y = 160$ with probability 0.8 and 100 with probability 0.2.
- All entrepreneurs and all lenders know the distribution of Y .
- The entrepreneur observes the realization of actual Y freely.
- The other cannot observe the total output of the project without paying a cost.
- f denotes total loan repayment (principal + interest) promised by each firm for a loan of 100.

- (a) Is an entrepreneur willing to speak the truth about the output of his/her project? Describe the moral hazard problem in this economy.

.....

.....

.....

.....

- (b) If we impose a punishment system such that the entrepreneur will be forced liquidation if he/she pays equal to or lower than a specified amount, f . Assume that liquidating gives no proceeds to the lenders and the entrepreneurs. Calculate the specified amount, which will lead to payments with an expected value of 108 on a loan of 100 ($r = 8\%$). Describe how the punishment system in this question helps solving the moral hazard problem.

2. "... Michael Dell, the founder of the world's third-largest PC-maker, announced that he planned to take his company private. ... Why does Mr. Dell, who took Dell public in a stock market in 1988, want to buy his company back again? ... Mr Dell's optimism is not shared by investors. Dell's share price fell from around \$30 in late 2007 to less than \$10 five years later ... Mr. Dell's calculation is that the shares are now undervalued. He is deciding to buy them back and take Dell private. ... "

The Economist, February 6, 2013

In the context of theory of financial intermediation, explain possible benefits Mr. Dell would get by buying shares back and taking Dell private.
