

HW#5 Due September 22, 2020

Mankiw Page 107

3. Suppose the price elasticity of demand for heating oil is $\overset{s\varepsilon_d}{0.2}$ in the short run and $\overset{l\varepsilon_d}{0.7}$ in the long run.
- a. If the price of heating oil rises from $\overset{P_{old}}{\$1.80}$ to $\overset{P_{new}}{\$2.20}$ per gallon, what happens to the quantity of heating oil demanded in the short run? In the long run? (Use the midpoint method in your calculations.)
- b. Why might this elasticity depend on the time horizon?

7. Suppose that your demand schedule for pizza is as follows:

Price	Quantity Demanded (income = \$20,000)	Quantity Demanded (income = \$24,000)
\$8	40 pizzas	50 pizzas
10	32	45
12	24	30
14	16	20
16	8	12

- a. Use the midpoint method to calculate your price elasticity of demand as the price of pizza increases from \$8 to \$10 if (i) your income is \$20,000 and (ii) your income is \$24,000.
- b. Calculate your income elasticity of demand as your income increases from \$20,000 to \$24,000 if (i) the price is \$12 and (ii) the price is \$16.

3)

a) the percentage change in price is $\frac{2.20-1.80}{2.00} = 0.2 = 20\%$

i) Quantity demanded will fall by $0.2 \times 0.2 = 4\%$ in the short run

ii) Quantity demanded will fall by $0.2 \times 0.7 = 14\%$ in the long run

b) In the long run, they are more easier to change price of heating oil than in the short run because when it take longer and longer demand will increase

7)

a.

$$\begin{aligned}
 \text{i) Mid point} &= \frac{Q_N - Q_0}{P_N - P_0} \times \frac{P_N + P_0}{Q_N + Q_0} = \frac{32 - 40}{10 - 8} \times \frac{10 + 8}{32 + 40} \\
 &= \frac{-8}{2} \times \frac{18}{72} \\
 &= \frac{-144}{144} = -1
 \end{aligned}$$

$$\begin{aligned}
 \text{ii) Mid point} &= \frac{Q_N - Q_0}{P_N - P_0} \times \frac{P_N + P_0}{Q_N + Q_0} = \frac{45 - 50}{10 - 8} \times \frac{10 + 8}{45 + 50} \\
 &= \frac{-5}{2} \times \frac{18}{95} \\
 &= -\frac{9}{19}
 \end{aligned}$$

b.

$$\begin{aligned}
 \text{i) } \frac{\% \Delta Q}{\% \Delta I} &= \frac{\frac{\Delta Q}{Q} \times 100}{\frac{\Delta I}{I} \times 100} = \frac{\frac{30 - 24}{24} \times 100}{\frac{24000 - 20000}{20000} \times 100} \\
 &= \frac{\frac{1}{4} \times 100}{\frac{1}{5} \times 100} \\
 &= \frac{25}{20} = 1.25 \text{ \#}
 \end{aligned}$$

$$\begin{aligned}
 \text{ii) } \frac{\% \Delta Q}{\% \Delta I} &= \frac{\frac{\Delta Q}{Q} \times 100}{\frac{\Delta I}{I} \times 100} = \frac{\frac{12 - 8}{8} \times 100}{\frac{29000 - 20000}{20000} \times 100} \\
 &= \frac{\frac{1}{2} \times 100}{\frac{1}{5} \times 100} = \frac{50}{20} = 2.5 \text{ \#}
 \end{aligned}$$
