

Q1:

a) Thailand want to achieve net-zero carbon emissions by 2065 as the climate change issues is very concerning.

b) Use mitigation policy in order to reduce greenhouse gas emission. For example, support the development of renewable energy sectors and use a circular economy in some industrial.

Q2: Disagree, because a cost-effective allocation of a uniformly mixed fund pollutant is where marginal cost equal to the marginal damage not the all sources or firms, meaning that in order to minimize the total cost of reduction if there are two sources of emission each source need to reduce their unit of emission to be equally at Q^* .
