

Standard Costs and Variances

Chapter 12

© 2015 McGraw-Hill Education

Standard Costs

Standards are benchmarks or “norms” for measuring performance. In managerial accounting, two types of standards are commonly used.

Quantity standards

specify how much of an input should be used to make a product or provide a service.

Price standards

specify how much should be paid for each unit of the input.

Examples: Firestone, Sears, McDonald’s, hospitals, construction and manufacturing companies.

1

Setting Direct Material Standards

Quantity Standards

Summarized in a Bill of Materials.

Price Standards

Final, delivered cost of materials, net of discounts.

2

Setting Direct Labor Standards

Time Standards

Use time and motion studies for each labor operation.

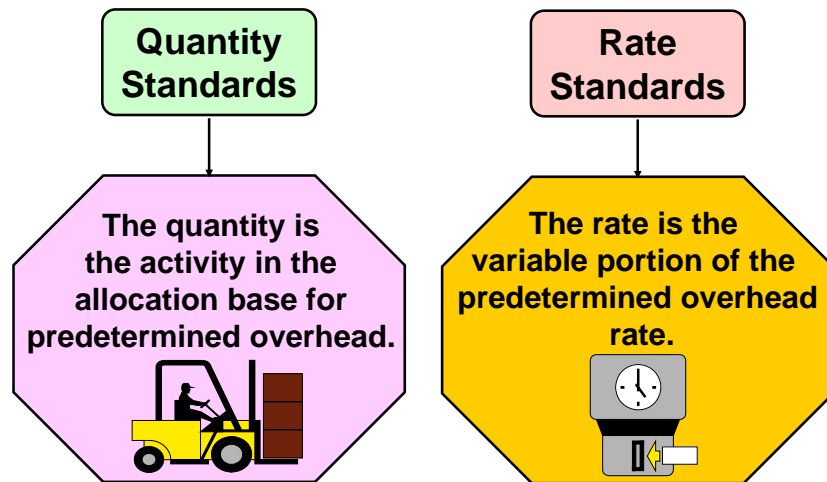

Rate Standards

Often a single rate is used that reflects the mix of wages earned.

3

Setting Variable Manufacturing Overhead Standards

4

Standard Cost Card – Variable Production Cost

A standard cost card for one unit of product might look like this:

Inputs	A	B	A x B
	Standard Quantity or Hours	Standard Price or Rate	Standard Cost per Unit
Direct materials	3.0 lbs.	\$ 4.00 per lb.	\$ 12.00
Direct labor	2.5 hours	14.00 per hour	35.00
Variable mfg. overhead	2.5 hours	3.00 per hour	7.50
Total standard unit cost			\$ 54.50

5

Using Standards in Flexible Budgets

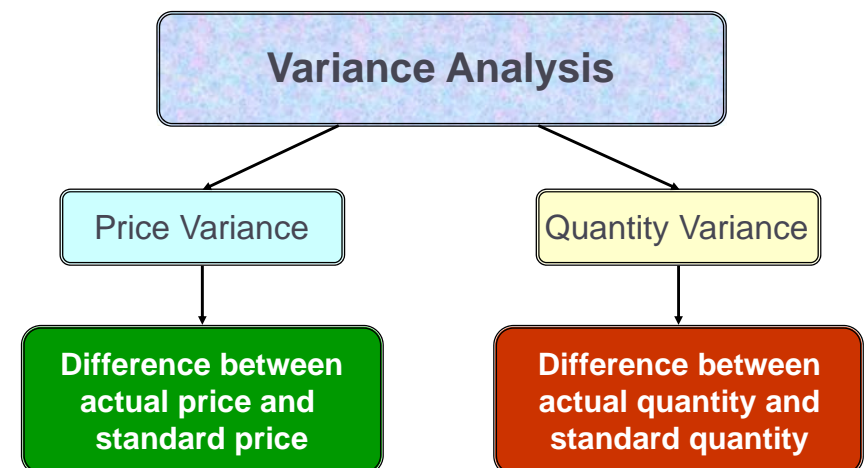

Standard costs per unit for direct materials, direct labor, and variable manufacturing overhead can be used to compute **activity** and **spending** variances.

Spending variances become more useful by breaking them down into price and quantity variances.

6

A General Model for Variance Analysis

7

Price and Quantity Standards

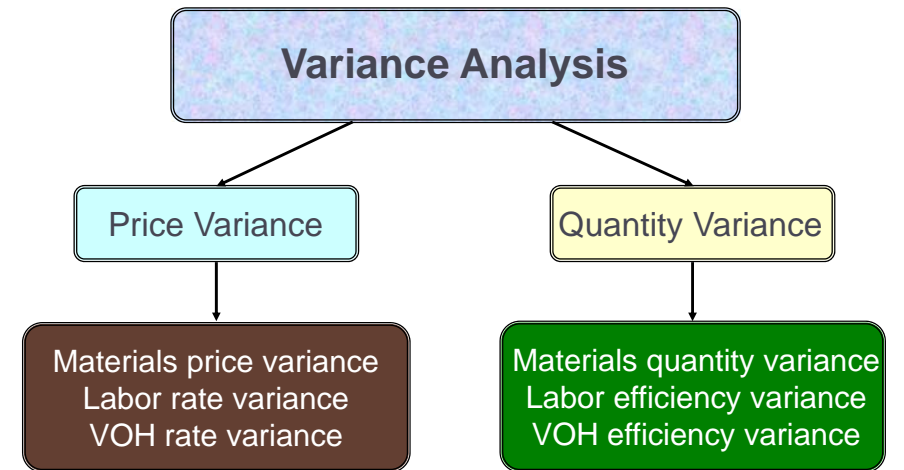

Price and quantity standards are determined separately for two reasons:

① The purchasing manager is responsible for raw material purchase prices and the production manager is responsible for the quantity of raw material used.

② The buying and using activities occur at different times. Raw material purchases may be held in inventory for a period of time before being used in production.

8

A General Model for Variance Analysis

9

A General Model for Variance Analysis

10

A General Model for Variance Analysis

Actual quantity is the amount of direct materials, direct labor, and variable manufacturing overhead actually used.

Standard quantity is the standard quantity allowed for the actual output of the period.

Actual price is the amount actually paid for the input used.

11

A General Model for Variance Analysis

$(AQ \times AP) - (AQ \times SP)$	$(AQ \times SP) - (SQ \times SP)$
$AQ = \text{Actual Quantity}$	$SP = \text{Standard Price}$
$AP = \text{Actual Price}$	$SQ = \text{Standard Quantity}$

12

Another Way to Look at the Problems: The line-by-line method

$SQ = (A_{\text{output}} \times \text{standard quantity for production})$
 = standard quantity allowed for the actual output

13

Notes:

14

Obj.#1 Compute the DM price & quantity variances

Material Variances – An Example

Glacier Peak Outfitters has the following direct material standard for the fiberfill in its mountain parka.

0.1 kg. of fiberfill per parka at \$5.00 per kg.

Last month 210 kgs. of fiberfill were purchased and used to make 2,000 parkas. The material cost a total of \$1,029.

15

Material Variances Summary: The tradition method

Actual Quantity × Actual Price	Actual Quantity × Standard Price	Standard Quantity × Standard Price
210 kgs. × \$4.90 per kg. = \$1,029	210 kgs. × \$5.00 per kg. = \$1,050	200 kgs. × \$5.00 per kg. = \$1,000
Price variance \$21 favorable		Quantity variance \$50 unfavorable

16

Material Variances: The line-by-line method

AQ x AP = 210 x AP = 1,029	→ (21) F Price variance
AQ x SP = 210 x 5 = 1,050	
SQ x SP = (2000 x 0.1) x 5 = 1,000	→ 50 U Quantity variance
<hr/>	
29 U Total Variance	

SQ = (Aouput x standard quantity for production)
= standard quantity allowed for the actual output

Calculation of Actual Purchase Price (AP) per unit can be done but is not necessary because AP will not be used in subsequent calculations and the total actual purchase cost in total is sufficient for the variance calculation.

17

Material Variances: Using the Factored Equations

Materials price variance

$$\begin{aligned}
 \text{MPV} &= \text{AQ} (\text{AP} - \text{SP}) \\
 &= 210 \text{ kgs} (\$4.90/\text{kg} - \$5.00/\text{kg}) \\
 &= 210 \text{ kgs} (-\$0.10/\text{kg}) \\
 &= \$21 \text{ F}
 \end{aligned}$$

Materials quantity variance

$$\begin{aligned}
 \text{MQV} &= \text{SP} (\text{AQ} - \text{SQ}) \\
 &= \$5.00/\text{kg} (210 \text{ kgs} - (0.1 \text{ kg/parka} \times 2,000 \text{ parkas})) \\
 &= \$5.00/\text{kg} (210 \text{ kgs} - 200 \text{ kgs}) \\
 &= \$5.00/\text{kg} (10 \text{ kgs}) \\
 &= \$50 \text{ U}
 \end{aligned}$$

18

Notes:

19

Isolation of Material Variances

I need the price variance sooner so that I can better identify purchasing problems. You accountants just don't understand the problems that **purchasing managers** have.

I'll start computing the price variance when material is purchased rather than when it's used.

Material Variances

Hanson purchased and used 1,700 pounds. How are the variances computed if the amount purchased **differs** from the amount used?

The price variance is computed on the entire quantity **purchased**.
The quantity variance is computed only on the quantity **used**.

Responsibility for Material Variances

Materials Price Variance

Materials Quantity Variance

Purchasing Manager

Production Manager

The standard price is used to compute the quantity variance so that the production manager is not held responsible for the purchasing manager's performance.

Responsibility for Material Variances

Your poor scheduling sometimes requires me to rush order material at a higher price, causing unfavorable price variances.

I am not responsible for this unfavorable material quantity variance.

You purchased cheap material, so my people had to use more of it.

Notes:

Quick Check ✓

Hanson Inc. has the following direct material standard to manufacture one Zippy:

1.5 pounds per Zippy at \$4.00 per pound

Last week, 1,700 pounds of material were purchased and used to make 1,000 Zippies. The material cost a total of \$6,630.

Hanson's material price variance (MPV) for the week was:

- \$170 unfavorable.
- \$170 favorable.
- \$800 unfavorable.
- \$800 favorable.

24

Quick Check ✓

Hanson's material quantity variance (MQV) for the week was:

- \$170 unfavorable.
- \$170 favorable.
- \$800 unfavorable.
- \$800 favorable.

26

Quick Check ✓ Continued

Hanson Inc. has the following material standard to manufacture one Zippy:

1.5 pounds per Zippy at \$4.00 per pound

Last week, **2,800 pounds** of material were purchased at a total cost of \$10,920, and 1,700 pounds were used to make 1,000 Zippies.

27

Quick Check ✓ Continued The line-by-line method

$AQ_p \times AP = 2,800 \times AP = 10,920$		$(280) \text{ F Price variance}$
$AQ_p \times SP = 2,800 \times 4 = 11,200$		$4,400 \text{ U Inventory @ Std cost}$
$AQ_u \times SP = 1,700 \times 4 = 6,800$		$800 \text{ U Usage variance}$ (Quantity variance)
$SQ \times SP = (1000 \times 1.5) \times 4 = 6,000$		$4,920 \text{ U Total Variance}$

AQ_p = Actual Quantity Purchased
 AQ_u = Actual Quantity used
 SQ = (Aoutput x standard quantity for production use)
 = standard quantity allowed for the actual output

28

Obj.#2 Compute the DL rate & efficiency variances

Labor Variances – An Example

Glacier Peak Outfitters has the following direct labor standard for its mountain parka.

1.2 standard hours per parka at \$10.00 per hour

Last month, employees actually worked 2,500 hours at a total labor cost of \$26,250 to make 2,000 parkas.

29

Obj.#2 Compute the DL rate & efficiency variances

Labor Variances

$AH \times AR = 2,500 \times AR = 26,250$		$1,250 \text{ U Rate variance}$
$AH \times SR = 2,500 \times 10 = 25,000$		$1,000 \text{ U Efficiency variance}$
$SH \times SR = (2000 \times 1.2) \times 10 = 24,000$		$2,250 \text{ U Total Variance}$

AH = Actual hour paid (and worked in this case)
 AR = Actual rate per hour
 SR = Standard rate per hour
 SH = (Aoutput x standard hours for the production)
 = standard hours allowed for the actual output

30

Obj.#2 Compute the DL rate & efficiency variances

Responsibility for Labor Variances

Production managers are usually held accountable for labor variances because they can influence the:

Mix of skill levels assigned to work tasks.

Level of employee motivation.

Quality of production supervision.

Quality of training provided to employees.

31

Responsibility for Labor Variances

I am not responsible for the unfavorable labor efficiency variance!

You purchased cheap material, so it took more time to process it.

I think it took more time to process the materials because the Maintenance Department has poorly maintained your equipment.

32

Quick Check ✓

Zippy

Hanson Inc. has the following direct labor standard to manufacture one Zippy:

1.5 standard hours per Zippy at \$12.00 per direct labor hour

Last week, 1,550 direct labor hours were worked at a total labor cost of \$18,910 to make 1,000 Zippies.

33

Quick Check ✓

Zippy

Hanson's labor rate variance (LRV) for the week was:

- a. \$310 unfavorable.
- b. \$310 favorable.
- c. \$300 unfavorable.
- d. \$300 favorable.

34

Quick Check ✓

Zippy

Hanson's labor efficiency variance (LEV) for the week was:

- a. \$590 unfavorable.
- b. \$590 favorable.
- c. \$600 unfavorable.
- d. \$600 favorable.

35

Variable Manufacturing Overhead Variances – An Example

Glacier Peak Outfitters has the following direct variable manufacturing overhead labor standard for its mountain parka.

1.2 standard hours per parka at \$4.00 per hour

Last month, employees actually worked 2,500 hours to make 2,000 parkas. Actual variable manufacturing overhead for the month was \$10,500.

36

Variable Manufacturing Overhead Variances: The line-by-line method

AH x AR	=	2,500	x	AR = 10,500		500 U Rate variance
AH x SR	=	2,500	x	4 = 10,000		400 U Efficiency variance
SH x SR	=	(2000 x 1.2)	x	4 = 9,600		900 U Total Variance
AH = Actual hour paid (and worked in this case) AR = Actual rate per hour SR = Standard rate per hour SH = (Aouput x standard hours for the production) = standard hours allowed for the actual output						

37

Variable Manufacturing Overhead Variances: Using Factored Equations

Variable manufacturing overhead rate variance

$$\begin{aligned}
 \text{VMRV} &= \text{AH} (\text{AR} - \text{SR}) \\
 &= 2,500 \text{ hours } (\$4.20 \text{ per hour} - \$4.00 \text{ per hour}) \\
 &= 2,500 \text{ hours } (\$0.20 \text{ per hour}) \\
 &= \$500 \text{ unfavorable}
 \end{aligned}$$

Variable manufacturing overhead efficiency variance

$$\begin{aligned}
 \text{VMEV} &= \text{SR} (\text{AH} - \text{SH}) \\
 &= \$4.00 \text{ per hour } (2,500 \text{ hours} - 2,400 \text{ hours}) \\
 &= \$4.00 \text{ per hour } (100 \text{ hours}) \\
 &= \$400 \text{ unfavorable}
 \end{aligned}$$

38

Quick Check ✓

Hanson Inc. has the following variable manufacturing overhead standard to manufacture one Zippy:

1.5 standard hours per Zippy at \$3.00 per direct labor hour

Last week, 1,550 hours were worked to make 1,000 Zippies, and \$5,115 was spent for variable manufacturing overhead.

39

Quick Check ✓

Hanson's rate variance (VMRV) for variable manufacturing overhead for the week was:

- \$465 unfavorable.
- \$400 favorable.
- \$335 unfavorable.
- \$300 favorable.

40

Quick Check ✓

Hanson's efficiency variance (VMEV) for variable manufacturing overhead for the week was:

- \$435 unfavorable.
- \$435 favorable.
- \$150 unfavorable.
- \$150 favorable.

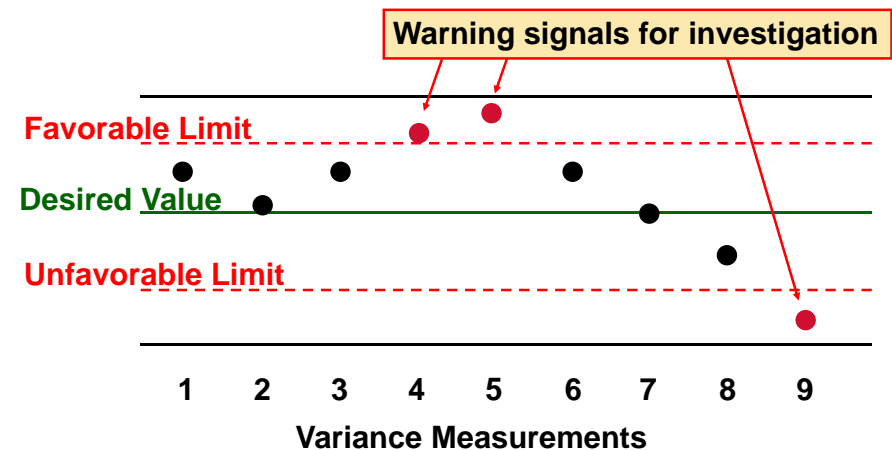

41

Variance Analysis and Management by Exception

42

A Statistical Control Chart

43

Advantages of Standard Costs

Management by exception

Promotes economy and efficiency

Simplified bookkeeping

Enhances responsibility accounting

Potential Problems with Standard Costs

Emphasizing standards may exclude other important objectives.

Favorable variances may be misinterpreted.

Standard cost reports may not be timely.

Emphasis on negative may impact morale.

Invalid assumptions about the relationship between labor cost and output.

Continuous improvement may be more important than meeting standards.

End of Chapter 12

Generalized Model of the Row by Row Approach and Its Preparation of the Performance Report (Reconcile Actual Results to the Budgeted Figures)

Supplementary Note

Generalized Model of the Row by Row Approach and Its Preparation of the Performance Report (Reconcile Actual Results to the Budgeted Figures)

Actual Quantity	x Actual Price	= AQ x AP	→ Price variance
Actual Quantity	x Standard Price	= AQ x SP	
Standard Quantity	x Standard Price	= SQ x SP	→ Quantity variance
Budgeted Quantity	x Standard Price	= BQ x SP	
			→ Total Flexible Variance
			→ Activity Variance
			→ Static variance

$SQ = (A_{output} \times \text{standard quantity for production})$
 = standard quantity allowed for the actual output
 $BQ = \text{Budgeted quantity}$

48

Performance Report for Variance Analysis: Recall Example from Chapter 11

	Revenue/Cost Formulas	Planning Budget	Activity Variances	Flexible Budget	Revenue and Spending Variances	Actual Results
Number of lawns (Q)		500		550		550
Revenue	(\$75Q)	\$ 37,500	\$ 3,750 F	\$ 41,250	\$ 1,750 F	\$ 43,000
Expenses:						
Wages and salaries	(\$5,000 + \$30Q)	\$ 20,000	\$ 1,500 U	\$ 21,500	\$ 2,000 U	\$ 23,500
Gasoline and supplies	(\$9Q)	4,500	450 U	4,950	150 U	5,100

49

Predetermined Overhead Rates and Overhead Analysis in a Standard Costing System

Appendix 12A

Obj.#4 Compute and interpret the fixed OH budget and volume variance

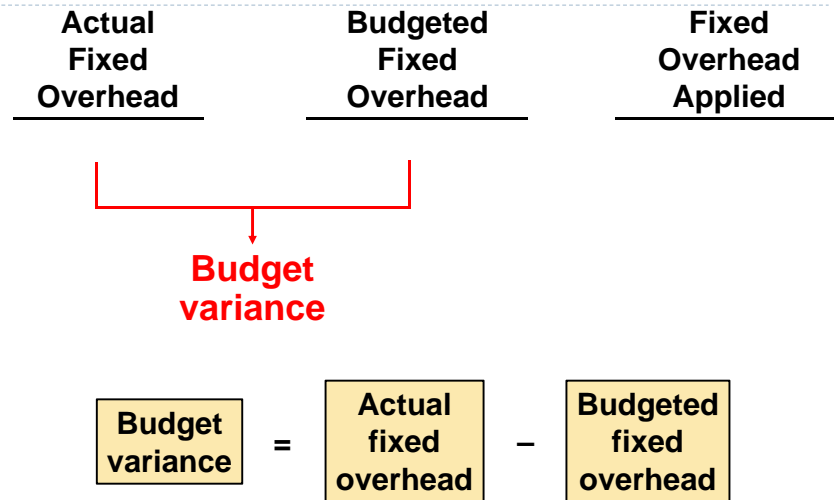

Fixed Manufacturing Overhead Variances: The line-by-line method

Actual Fixed Overhead		→ Budget variance (Spending variance)
Budgeted Fixed Overhead	= BH x SR	
Applied Fixed Overhead	= SH x SR	→ Volume variance
		→ Total Variance

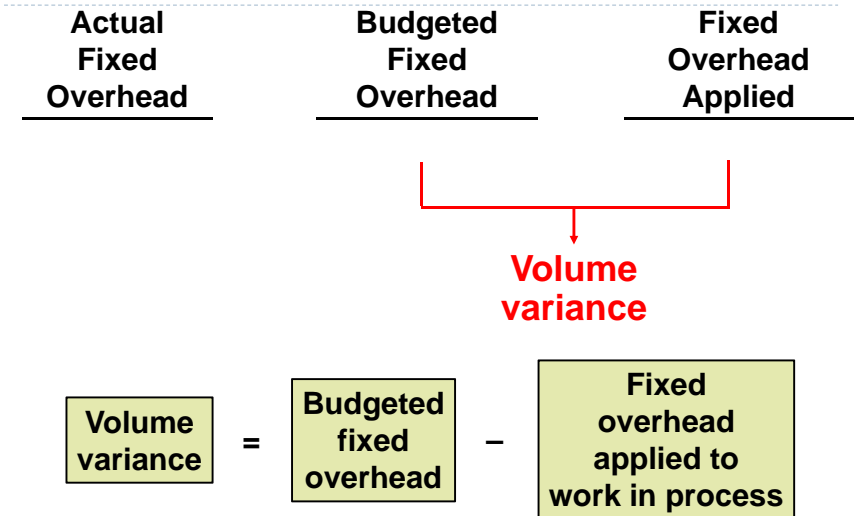

BH = Budgeted hours (a.k.a. Denominator hours)
 $SH = (A_{output} \times \text{standard hours for the production})$
 = standard hours allowed for the actual output

51

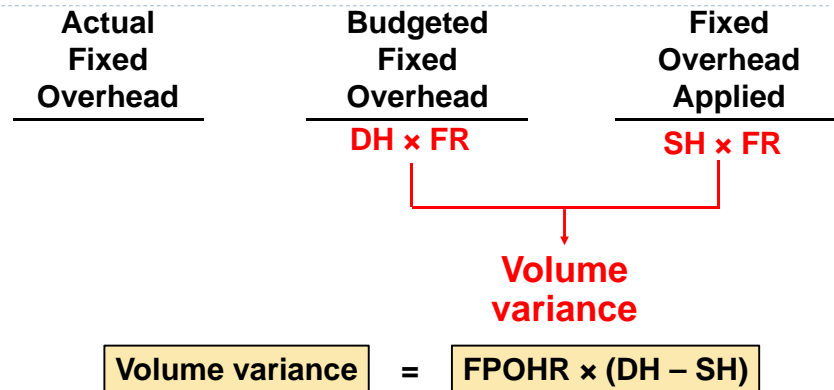

Fixed Overhead Budget Variance: The traditional method

Fixed Overhead Volume Variance: The traditional method

Fixed Overhead Volume Variance: The traditional method

FPOHR = Fixed portion of the predetermined overhead rate
DH = Denominator hours
SH = Standard hours allowed for actual output

Computing Fixed Overhead Variances

ColaCo Production and Machine-Hour Data	
Budgeted production	30,000 units
Standard machine-hour per unit	3 hours
Budgeted machine-hour	90,000 hours
Actual production	28,000 units
Standard machine-hour allowed for the actual production	84,000 hours
Actual machine-hour	88,000 hours

Computing Fixed Overhead Variances

ColaCo Cost Data	
Budgeted variable manufacturing overhead	\$ 90,000
Budgeted fixed manufacturing overhead	270,000
Total budgeted manufacturing overhead	\$ 360,000
Actual variable manufacturing overhead	\$ 100,000
Actual fixed manufacturing overhead	280,000
Total actual manufacturing overhead	\$ 380,000

56

Predetermined Overhead Rates

$$\text{Predetermined overhead rate} = \frac{\text{Estimated total manufacturing overhead cost}}{\text{Estimated total amount of the allocation base}}$$

$$\text{Predetermined overhead rate} = \frac{\$360,000}{90,000 \text{ Machine-hour}}$$

$$\text{Predetermined overhead rate} = \$4.00 \text{ per machine-hour}$$

57

Predetermined Overhead Rates

$$\text{Variable component of the predetermined overhead rate} = \frac{\$90,000}{90,000 \text{ Machine-hour}}$$

$$\text{Variable component of the predetermined overhead rate} = \$1.00 \text{ per machine-hour}$$

$$\text{Fixed component of the predetermined overhead rate} = \frac{\$270,000}{90,000 \text{ Machine-hour}}$$

$$\text{Fixed component of the predetermined overhead rate} = \$3.00 \text{ per machine-hour}$$

58

Applying Manufacturing Overhead

$$\text{Overhead applied} = \text{Predetermined overhead rate} \times \text{Standard hours allowed for the actual output}$$

$$\text{Overhead applied} = \$4.00 \text{ per machine-hour} \times 84,000 \text{ machine-hour}$$

$$\text{Overhead applied} = \$336,000$$

59

Fixed Manufacturing Overhead Variances The line-by-line method

Actual	=	280,000	→	10,000 U Budget variance
Budgeted	=	270,000		
SH x SR	=	(28000 x 3) x 3 = 252,000	→	18,000 U Volume variance
			28,000 U Total Underapplied overhead	

SH = (A_{output} x standard hours for the production)
= standard hours allowed for the actual output

60

Computing the Budget Variance: The traditional method

$$\text{Budget variance} = \text{Actual fixed overhead} - \text{Budgeted fixed overhead}$$

$$\text{Budget variance} = \$280,000 - \$270,000$$

$$\text{Budget variance} = \$10,000 \text{ Unfavorable}$$

61

Computing the Volume Variance: The traditional method

$$\text{Volume variance} = \text{Budgeted fixed overhead} - \text{Fixed overhead applied to work in process}$$

$$\text{Volume variance} = \$270,000 - \left(\$3.00 \text{ per machine-hour} \times \$84,000 \text{ machine-hour} \right)$$

$$\text{Volume variance} = \$18,000 \text{ Unfavorable}$$

62

Computing the Volume Variance: The traditional method

$$\text{Volume variance} = \text{FPOHR} \times (\text{DH} - \text{SH})$$

FPOHR = Fixed portion of the predetermined overhead rate
DH = Denominator hours
SH = Standard hours allowed for actual output

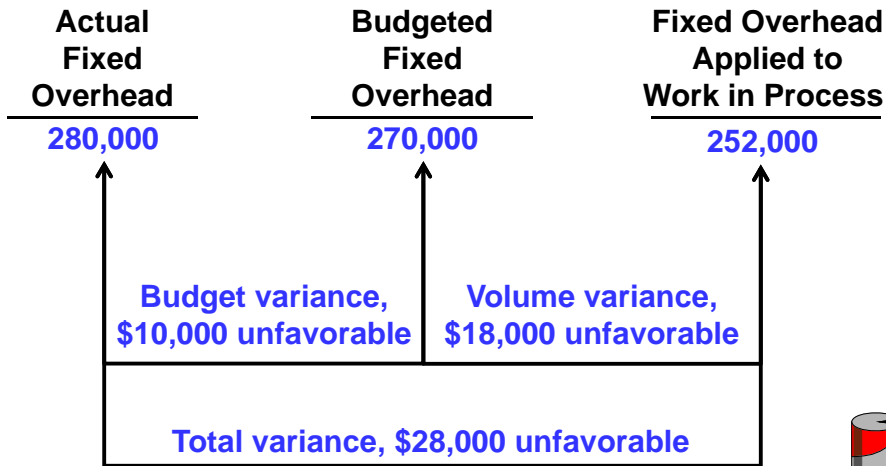

$$\text{Volume variance} = \$3.00 \text{ per machine-hour} \times \left(90,000 \text{ machine-hour} - 84,000 \text{ machine-hour} \right)$$

$$\text{Volume variance} = 18,000 \text{ Unfavorable}$$

63

A Pictorial View of the Variances

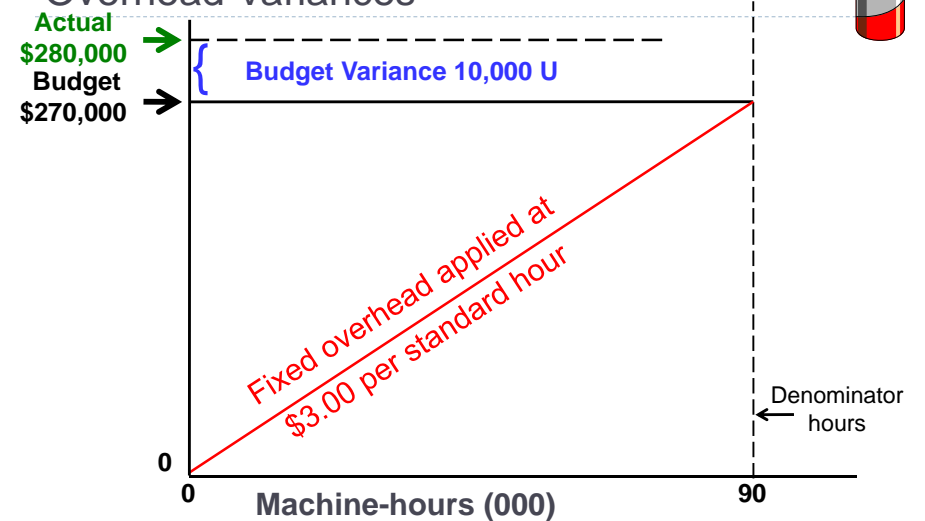

Fixed Overhead Variances – A Graphic Approach

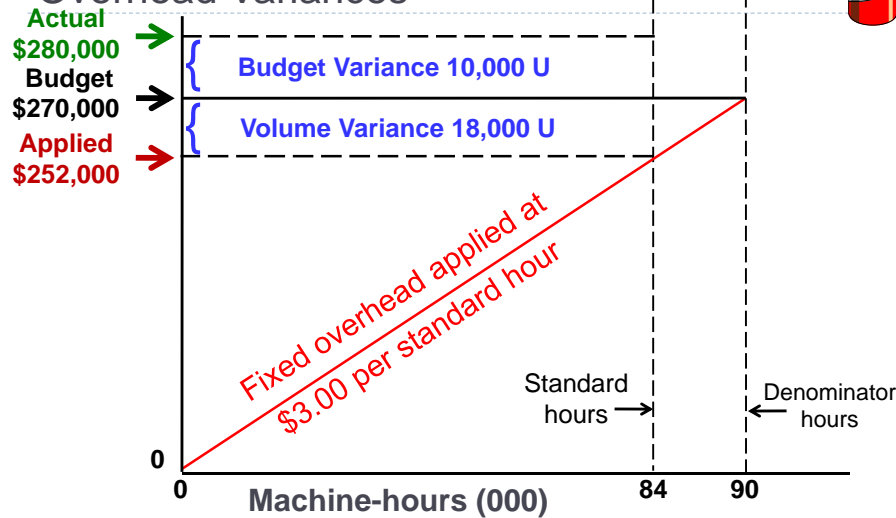

Graphic Analysis of Fixed Overhead Variances

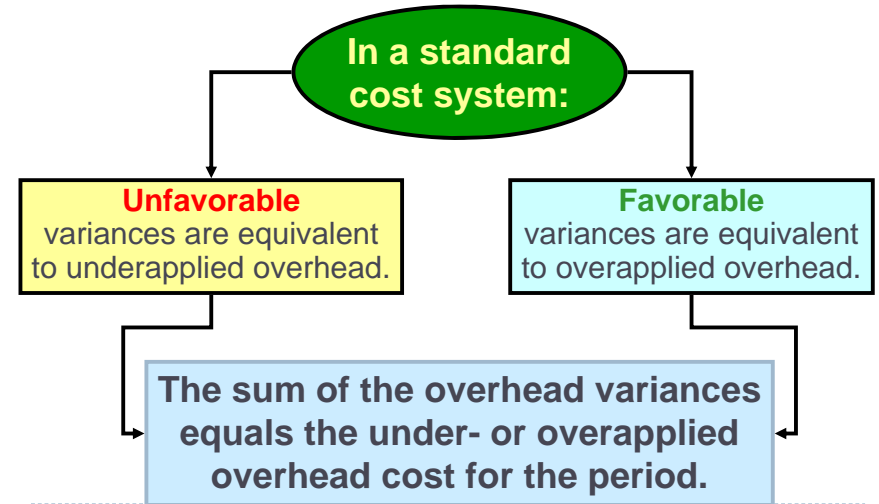

Graphic Analysis of Fixed Overhead Variances

Graphic Analysis of Fixed Overhead Variances

Reconciling Overhead Variances and Underapplied or Overapplied Overhead

Reconciling Overhead Variances and Underapplied or Overapplied Overhead

ColaCo Computation of Underapplied Overhead		
Predetermined overhead rate (a)	\$ 4.00	per machine-hour
Standard hours allowed for the actual output (b)	84,000	machine hours
Manufacturing overhead applied (a) × (b)	\$ 336,000	
Actual manufacturing overhead	\$ 380,000	
Manufacturing overhead underapplied or overapplied	\$ 44,000	underapplied

Variable Overhead Variances: The line-by-line method

AH x AR	=		=	100,000		
AH x SR	=	88,000	x	1	=	88,000
SH x SR	=	84,000	x	1	=	84,000
		(= 28,000 x 3)				
						16,000 U Total Variance
SR = Standard rate per hour						= Total underapplied variable overhead
SH = (Aoutput x standard hours for the production)						
		= standard hours allowed for the actual output				

Computing the Variable Overhead Variances: The factored equation method

Variable manufacturing overhead rate variance

$$\begin{aligned} \text{VMRV} &= (\text{AH} \times \text{AR}) - (\text{AH} \times \text{SR}) \\ &= \$100,000 - (88,000 \text{ hours} \times \$1.00 \text{ per hour}) \\ &= \$12,000 \text{ unfavorable} \end{aligned}$$

72

Computing the Variable Overhead Variances The traditional method

Variable manufacturing overhead efficiency variance

$$\begin{aligned} \text{VMEV} &= (\text{AH} \times \text{SR}) - (\text{SH} \times \text{SR}) \\ &= \$88,000 - (84,000 \text{ hours} \times \$1.00 \text{ per hour}) \\ &= \$4,000 \text{ unfavorable} \end{aligned}$$

73

Computing the Sum of All Variances

ColaCo

Computing the Sum of All variances

Variable overhead rate variance	\$	12,000	U
Variable overhead efficiency variance		4,000	U
Fixed overhead budget variance		10,000	U
Fixed overhead volume variance		18,000	U
Total of the overhead variances	\$	44,000	U

74
