

## 5. Interval Estimation and Hypothesis Testing

### Interval Estimation

**5.1** Confidence Intervals for Regression Coefficients  $\beta_1$  and  $\beta_2$

**In Sum**

A  $100(1 - \alpha)$  percent **confidence interval** for  $\beta_2$  can be defined as:

$$\hat{\beta}_2 \pm t_{\alpha/2} \text{se}(\hat{\beta}_2)$$

or

$$\Pr[\hat{\beta}_2 - t_{\alpha/2} \text{se}(\hat{\beta}_2) \leq \beta_2 \leq \hat{\beta}_2 + t_{\alpha/2} \text{se}(\hat{\beta}_2)] = 1 - \alpha$$

Analogously, we can define  $100(1 - \alpha)$  percent **confidence interval** for  $\beta_1$  as:

$$\hat{\beta}_1 \pm t_{\alpha/2} \text{se}(\hat{\beta}_1)$$

or

$$\Pr[\hat{\beta}_1 - t_{\alpha/2} \text{se}(\hat{\beta}_1) \leq \beta_1 \leq \hat{\beta}_1 + t_{\alpha/2} \text{se}(\hat{\beta}_1)] = 1 - \alpha$$

**Example**

Table 5.1: Estimating the expenditure of the household with income

<b>Family (i)</b>	Actual $Y_i$	Income $X_i$	$X - \bar{X}$	$Y - \bar{Y}$	$(X - \bar{X})(Y - \bar{Y})$	$(X - \bar{X})^2$
1	390	500	-250	-153.17	38291.67	62500
2	425	600	-150	-118.17	17725.00	22500
3	560	700	-50	16.83	-841.67	2500
4	575	800	50	31.83	1591.67	2500
5	630	900	150	86.83	13025.00	22500
6	679	1000	250	135.83	33958.33	62500
Sum	3259	4500	0	0	103750	175000

Table 5.2: Estimating the expenditure of the household with income

<b>Family (i)</b>	Actual $Y_i$	Income $X_i$	Regression Estimate $\hat{Y}$	Residual $Y - \hat{Y}$	Residual squared $(Y - \hat{Y})^2$
1	390	500	394.95	-4.95	24.53
2	425	600	454.24	-29.24	854.87
3	560	700	513.52	46.48	2160.04
4	575	800	572.81	2.19	4.80
5	630	900	632.10	-2.10	4.39
6	679	1000	691.38	-12.38	153.29
Sum	3259	4500	0	0	3201.90

**Confidence Interval for  $\beta_2$**

**Confidence Interval for  $\beta_1$**

**5.2 Confidence Interval for  $\sigma^2$** 

### 5.3 Hypothesis Testing: The Confidence-Interval Approach

Based on our sample data, the estimated marginal propensity to consume (MPC),  $\hat{\beta}_2$  is 0.593.  
Suppose we postulate that

$$H_0 : \beta_2 = 0.6$$

$$H_1 : \beta_2 \neq 0.6$$

## 5.4 Hypothesis Testing: The Test of Significance Approach

### 5.4.1 Two-Tail Test

Based on the sample data, the estimated marginal propensity to consume (MPC),  $\hat{\beta}_2$  is 0.593. Suppose we postulate that

$$H_0 : \beta_2 = 0.6$$

$$H_1 : \beta_2 \neq 0.6$$

**5.4.2 One-Tail Test**

Based on the sample data, the estimated marginal propensity to consume (MPC),  $\hat{\beta}_2$  is 0.593. Suppose we postulate that

$$H_0 : \beta_2 \leq 0.6$$

$$H_1 : \beta_2 > 0.6$$

We can summarize the decision rules for the  $t$  test as follow:

**Figure 5.1 The  $t$  test of Significance: Decision rules**

Type of hypothesis	$H_0$ : the null hypothesis	$H_1$ : the alternative hypothesis	Decision rule: reject $H_0$ if
Two-tail	$\beta_2 = \beta_2^*$	$\beta_2 \neq \beta_2^*$	$ t  > t_{\alpha/2,df}$
Right-tail	$\beta_2 \leq \beta_2^*$	$\beta_2 > \beta_2^*$	$t > t_{\alpha,df}$
Left-tail	$\beta_2 \geq \beta_2^*$	$\beta_2 < \beta_2^*$	$t < -t_{\alpha,df}$

*Notes:*  $\beta_2^*$  is the hypothesized numerical value of  $\beta_2$ .

$|t|$  means the absolute value of  $t$ .

$t_\alpha$  or  $t_{\alpha/2}$  means the critical  $t$  value at the  $\alpha$  or  $\alpha/2$  level of significance.

df: degrees of freedom,  $(n - 2)$  for the two-variable model,  $(n - 3)$  for the three-variable model, and so on.

The same procedure holds to test hypotheses about  $\beta_1$ .

#### 5.4.3 Testing the significance of $\sigma^2$ : The $\chi^2$ test

**Figure 5.2 The  $\chi^2$  Test : Decision rules**

$H_0$ : the null hypothesis	$H_1$ : the alternative hypothesis	Critical region: reject $H_0$ if
$\sigma^2 = \sigma_0^2$	$\sigma^2 > \sigma_0^2$	$\frac{df(\hat{\sigma}^2)}{\sigma_0^2} > \chi_{\alpha,df}^2$
$\sigma^2 = \sigma_0^2$	$\sigma^2 < \sigma_0^2$	$\frac{df(\hat{\sigma}^2)}{\sigma_0^2} < \chi_{(1-\alpha),df}^2$
$\sigma^2 = \sigma_0^2$	$\sigma^2 \neq \sigma_0^2$	$\frac{df(\hat{\sigma}^2)}{\sigma_0^2} > \chi_{\alpha/2,df}^2$ or $< \chi_{(1-\alpha/2),df}^2$

*Note:*  $\sigma_0^2$  is the value of  $\sigma^2$  under the null hypothesis. The first subscript on  $\chi^2$  in the last column is the level of significance, and the second subscript is the degrees of freedom. These are critical chi-square values. Note that df is  $(n - 2)$  for the two-variable regression model,  $(n - 3)$  for the three-variable regression model, and so on.

**Why do we say “we cannot reject the null hypothesis?” instead of “We accept the null hypothesis”**

**The Level of Significance:  $\alpha$** **Type I error****Type II error**

**The Exact Level of Significance: The p Value**

### 5.4.1 Regression Analysis and Analysis of Variance

--

Table 5.3: ANOVA Table for the two-variable regression model

Source of variation	Sum of Square SS	df	Mean Sum of Square MSS
