ECONOMIC GROWTH: CONCEPTS AND PATTERNS

EE 462 Development Macroeconomics

Semester 1/2015

Topics

- Divergent Patterns of Economic Growth since 1960
- Factor Accumulation, Productivity Growth, Econ. Growth
- Saving, Investment, & Capital Accumulation
- Sources of Growth Analysis
- Characteristics of Rapidly Growing Countries

Divergent Patterns of Economic Growth since 1960

Group	Ratios of 2009 to 1960 GDP/capita	Avg. Annual Growth Rates (%)	Examples of Countries
Negative growth	0.89 0.98	- 0.23 - 0.24	Madagascar Zambia
Slow growth	1.05 – 2.16	0.01 – 1.58	Senegal, Kenya, Peru, Chad, S.Africa, Phililines
Moderate growth	3.06 – 4.29	2.31 – 3.01	Turkey, Brazil, Chile, Lesotho, Mauritius
Rapid growth	4.55 – 18.94	3.14 – 6.18	India, Egypt, Malaysia, Thailand, Botswana, China
Industrialized	2.6 – 5.13	1.97 – 3.4	UK, US, Canada, Japan

Calculating Future Values

- *Question: why small differences in growth rates can make a big difference in income levels over time?*
- Suppose a country's current income/capita is X_0, and the growth rate is *r*% per year. What will be the income level in year *t*?

  ➔ $X_t = X_0 \times (1+r)^t$

- Example: GDP per capita (2005 PPP) in Thailand was 7,794 in 2009. If the average growth rate is 5% per year, what would be Thailand's GDP per capita GDP in 2019?

  ➔ $GDP_{2019} =$

  ➔ $GDP_{2019}/GDP_{2009} =$

- If r = 7%, X_{10} =? Ans. $GDP_{2019} =$

Calculating Growth Rates

- Suppose a country's current income/capita is X_0, and the income level in year X_0.?. What's the annual average growth rate? (Recall: $X_t = X_0 \times (1+r)^t$)

1. Calculate growth rate using the *endpoint data*.

   ➔ r =

   Ex. X_0=7,794 and X_t =12,695 ➔ *r* = ……

2. Estimate average growth rate by *least-square regression*.

   - $lnX_t = lnX_0 + ln(1+r) \times t$
   - Regression: $lnX_t = a + bt$ where $a = lnX_0$ and $b = ln(1+r)$

   ➔ *r* =

Factor Accumulation, Productivity Growth, Economic Growth

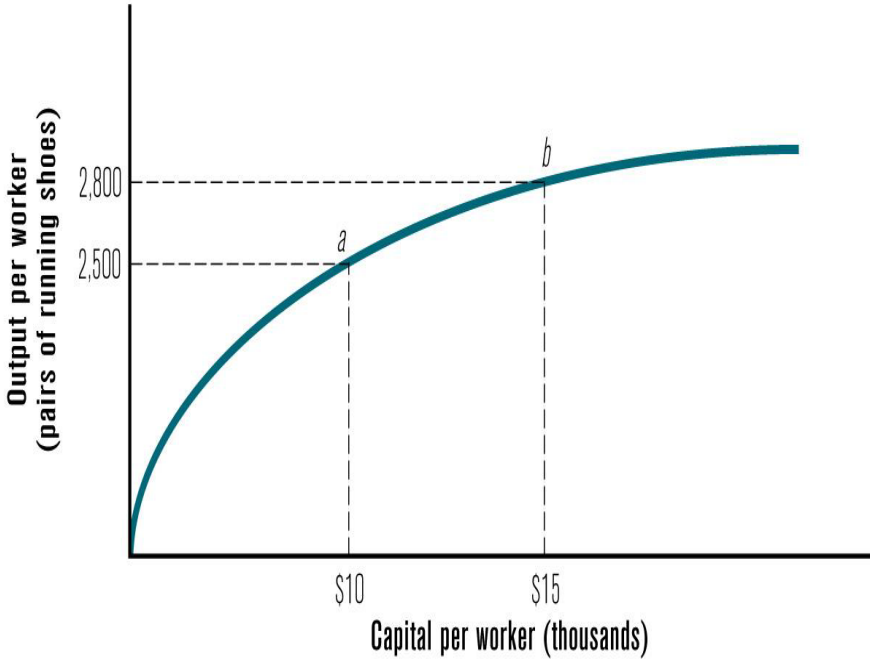
- Economic growth depends on two processes:

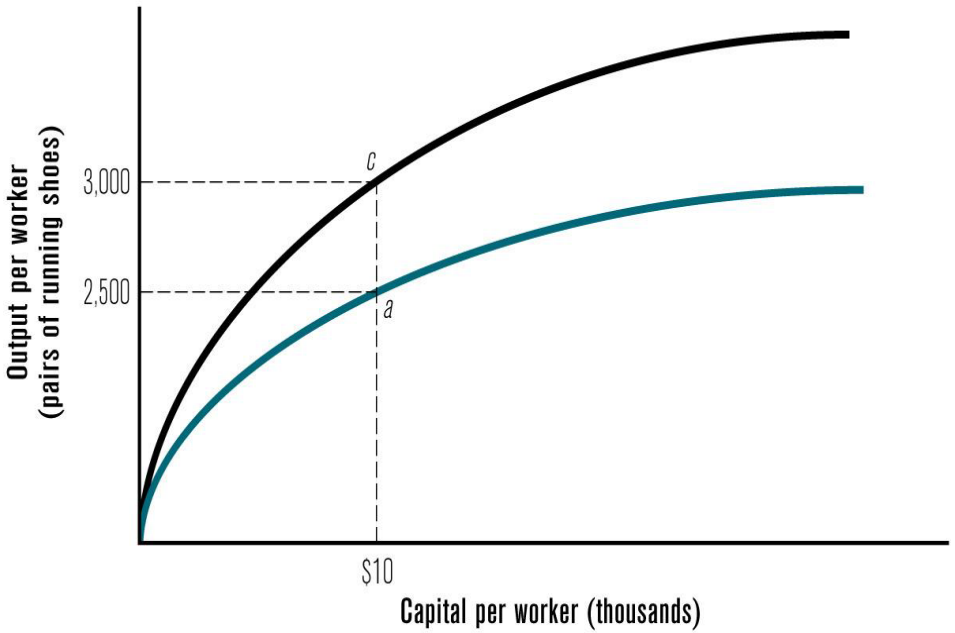
1. *Factor Accumulation*
   - Increasing in the size of capital stock and labor force.
2. *Productivity Growth*
   - Increasing the amount of output per unit of machine or worker
   - productivity can be increased by greater efficiency (e.g. specialization), and technological change.

- This can be explained using production function

  Q= f(Labor, Capital, etc…)

Basic Sources of Economic Growth





Saving, Investment & Capital Accumulation

- Solow growth model:
  - Explores the contribution of each factor to increase to output: Q(K, L, Productivity gains)
- Key elements of economic growth:
  - New investment increases the capital stock
  - Investment (I) is financed through savings (S)
  - Savings comes from current income of GDP: S= f(Y)
- *Sustaining Growth requires both generating new investment and making sure it is productive*.

Sources of Growth Analysis

- Growth accounting (or source of growth analysis) measures the relationship between productivity change and economic growth
- Total factor productivity (TFP): contribution to production of efficiency, technology, and other influences on productivity
- The growth equation can be written as:

$$g_Y = (W_k \times g_K) + (W_n \times g_L) + a$$

where

- g_Y = growth of total income (or GDP)
- g_K, g_L = growth of capital and labor
- W_k, W_n = share of capital and labor
- a= rate of productivity of inputs = "Solow residual"

Growth Accounting (Cont'd)

- Example: Assume the following: g_Y =0.05, g_K=0.07, g_L= 0.02, W_L=0.6, and W_K= 0.4. a = ?
  - Recall $g_Y = (W_k \times g_K) + (W_n \times g_L) + a$
  - Substitute:
    - TFP growth:
    - Growth in K accounts for % of g_Y
    - Growth in L accounts for % of g_Y
- Problems with Solow residual:
  - could represent influences other than productivity gains.
  - "a" captures the measurement errors and omitted variables because it is the residual in the equation.

Sources of Growth: Empirical Evidence

General findings:

- Economic growth in industrialized countries are attributed vastly by TFP, and less by capital accumulation.
- Data problems and price distortions are major concerns in developing countries.
- Sources of econ growth in LDCs attribute a larger role to capital accumulation than in industrialized countries. Why?
- Among developing countries, TFP growth in East Asia was faster than that in other regions.
- TFP growth tends to become more important as income rises.

Sources of Growth Across Countries 1960-2000 (1980s)

Country/ Region	Growth of Output per worker	Capital per worker	Education per worker	TFP
Brazil	-1.63	0.16	0.68	-2.47
Ethiopia	-1.74	1.11	0.27	-3.12
Ghana	-1.14	-1.23	0.15	0.07
Africa	-1.06	-0.07	0.42	-1.41
East Asia	4.36	2.45	0.66	1.25
Latin America	-1.77	0.04	0.47	-2.28
Middle East	1.15	0.55	0.53	0.07
South Asia	0.68	1.02	0.42	2.25
Industrialized	1.82	0.69	0.24	0.9

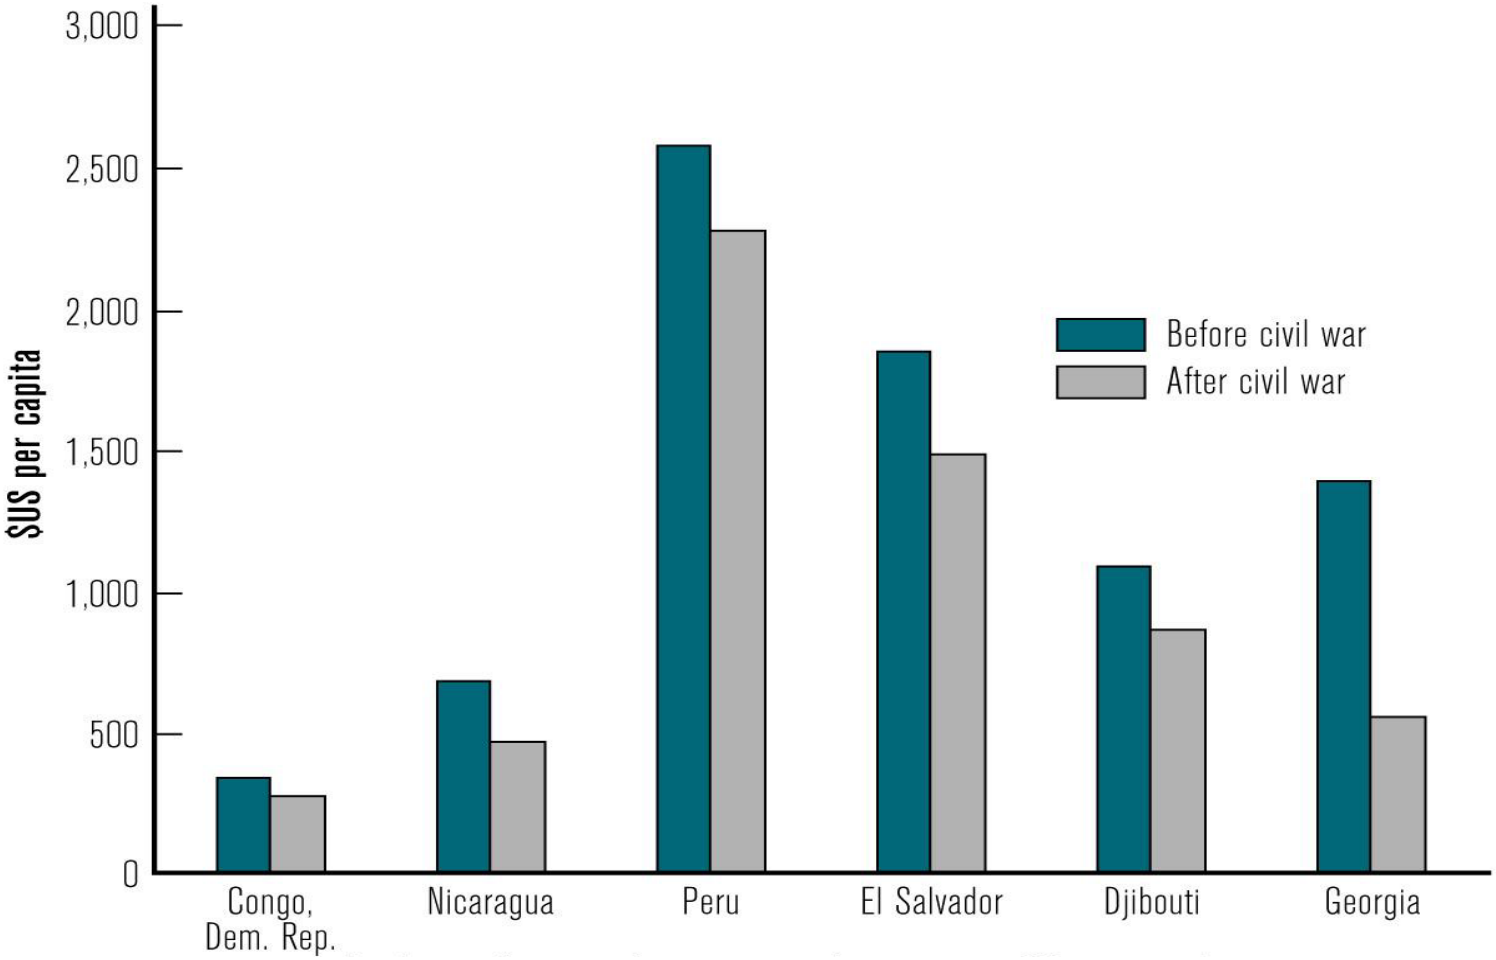
Characteristics of Rapidly Growing Countries

- Why some economies growth faster than others?
  - Need to look at empirical evidence; there's no consensus
  - Important to ask "which causes which?"

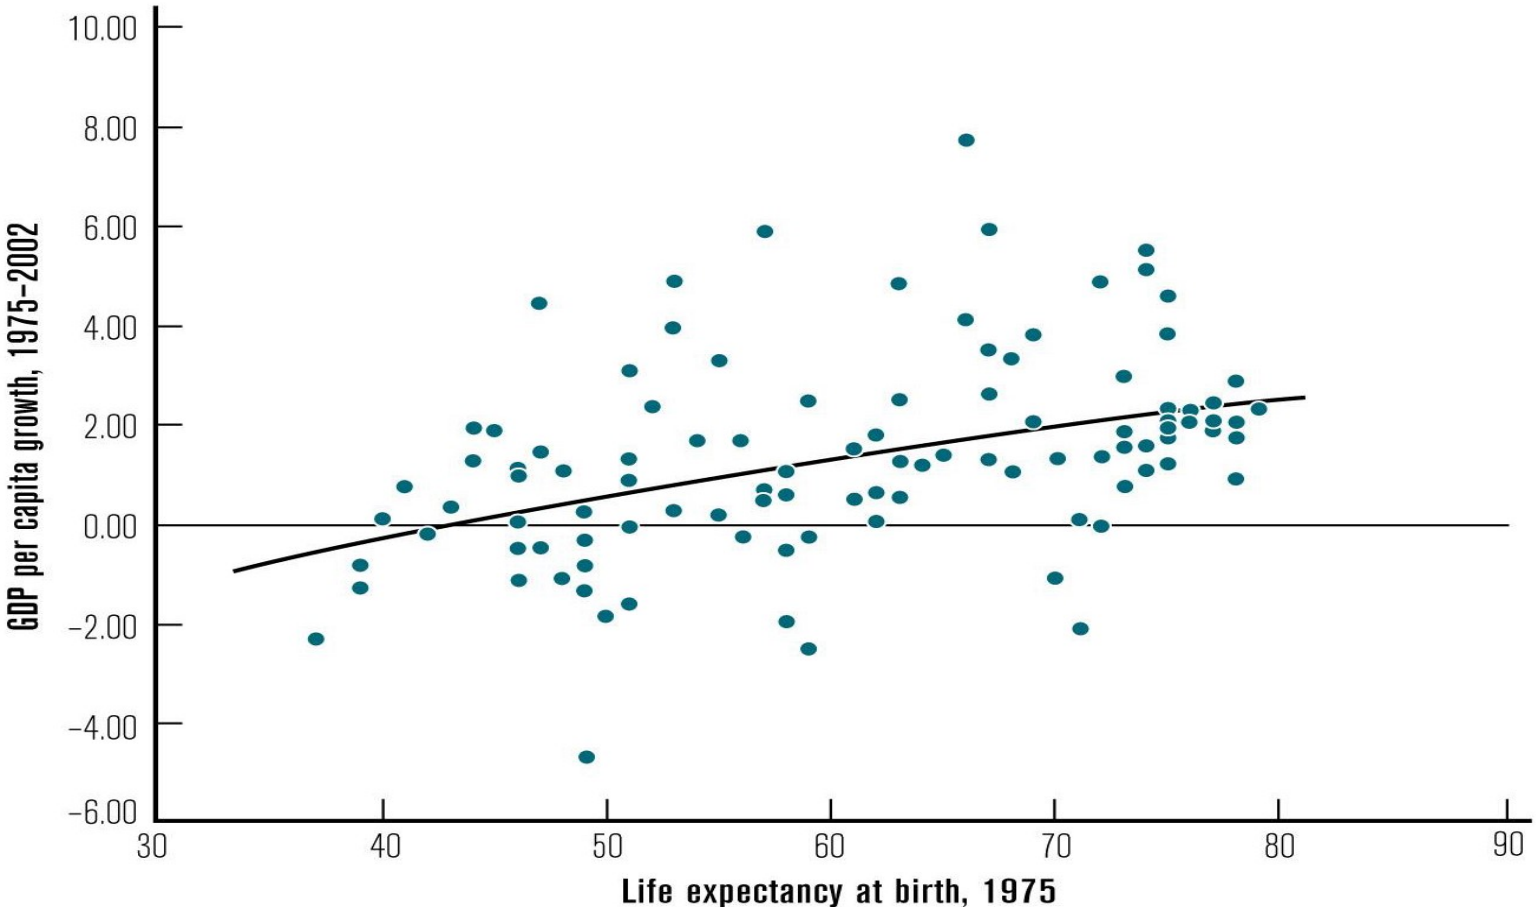
- Six broad characteristics that fast-growing countries share:
  1. Macroeconomic stability
  2. Investment in health and education*
  3. Effective governance and institutions
  4. Favorable environment to private enterprise
  5. Trade, openness, and growth*
  6. Favorable geography or location?

GDP per capita before and after a Civil War



➔ Average income was 28% lower after the civil war than before.

Growth and Life Expectancy

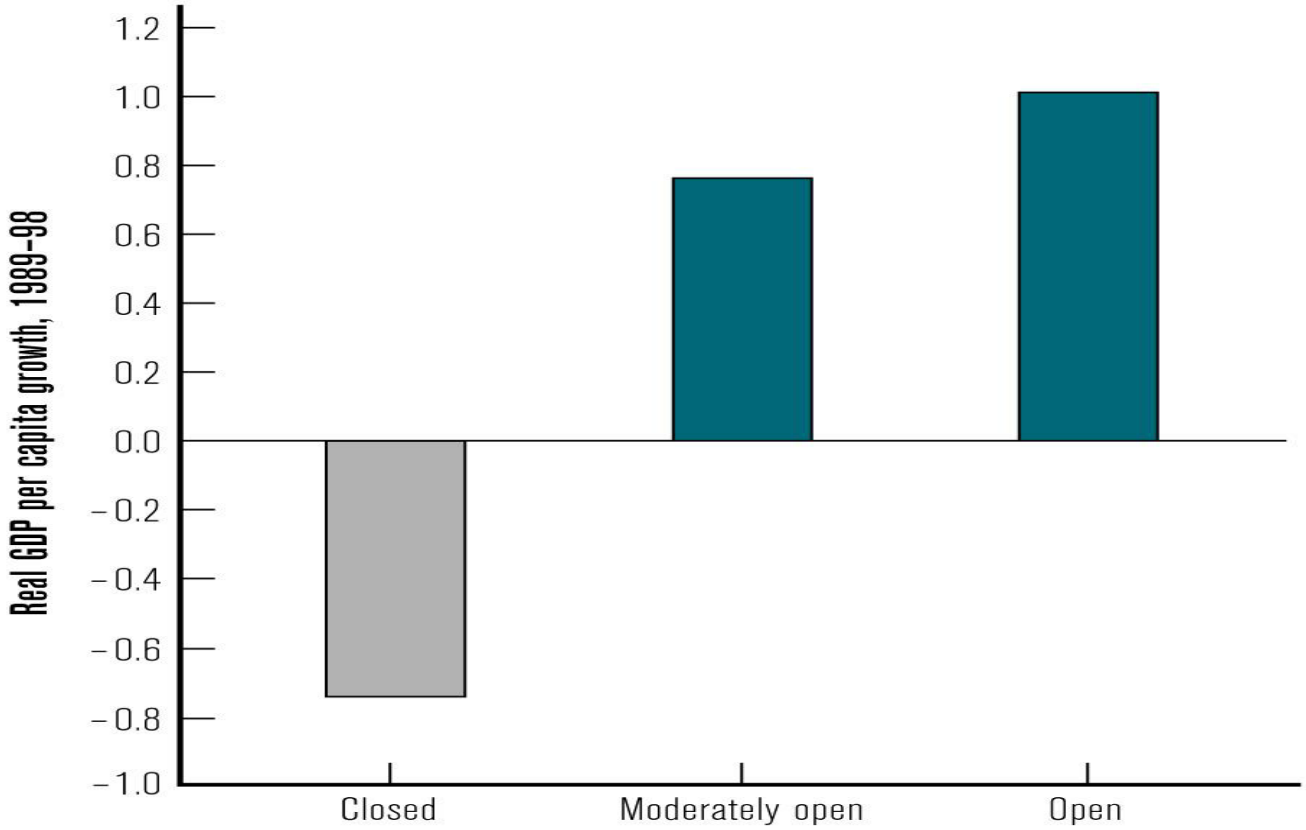


Better health → faster growth OR faster growth (higher income) → improve LE?

Institutions, Governance & Growth [Box 3.2]

- 5 institutions are necessary according to Rodrik and Subramanian (2003):
  1. *Market-creating institutions*: protect property rights
  2. *Market-regulating institutions*: deal with market failure
  3. *Market-stabilizing institutions*: control macroeconomic volatility
  4. *Market-legitimizing institutions*: provide social protection and insurance
  5. *Political institutions*: how a country is governed & extent of political participation

Openness and Growth



Inconclusive evidences:

1. How to construct measure of trade policy orientation
2. Pro-trade policies → growth?

Does geography matter?
