

Cause and effect from dam

The lower Sesan 2 Dam, China builds this dam that cut the Mekong River from the up of the river before enter Cambodia has cause a lot of the damage to economic and also environment.

The freshwater ecosystem has been affected by this construct, the thousands of migrating fish species has been prevented from traveling up and down, disrupt their habitat and they feeding and reproductive, from this case we see that the water is contaminated from the constructing the dam

Another group that has been affected with this dam is the Cambodian villager that live below the dam since the water from river was enough to growing a crop and normally, they catch fish 40 kg each day now they got roughly 2 kg As you can see this dam was not benefit to person below the dam or even the environment.

Why this dam built? Why this dam connects economic with environment. Economic growth is the problem in this case since the Cambodian government want to get money that will be the sentiment for building the dam to invest in infrastructure to generate for the country but did not concern about how the environment will be effect. The dam that claims to be clean energy but in this case of dam have almost the same amount of carbon footprint as fossil fuel that might be the dishonest of the China government for the benefit of the country but careless about the environment.

From this case we can see that ever agenda that harm the environment mostly cost by the economic somehow, but people try to hide the true cause of this and careless about the world.
