

Applied Economics for Natural Resources and Environment

Problem : The Ecosystem in Mekong river has collapsed Also, flooded the villages nearby

The causes of the problem: China built dam of the project called (BRI)

The key economic insights

1. People lived in villages have less income.

Villagers have income by sell fish from the Mekong River and vegetable that they grew. If dam built in these thing are gone by they need to travel more to the area that have fish and soil will dry and rocky so they hard to farm.

2. Government didn't match the compensation that they needed.

Government give only US 6,000 to build new homes. But it isn't enough. To the actual that they lost from the dam. So, people offered training new skill that would generate an income such as

welding, woodwork
