

Today, many countries are facing environmental problems. What do you think the cause is and how is it related to the country's economy? How do people measure the prosperity of each country? Economic growth? Development of technology? High cost of living? or GDP? Not at all. An indicator of a country's true prosperity is based on the livelihoods of their people. For example, a country that ranks among the wealthiest, but not everyone in the country has a good living, so what's the reason? Each country aims to develop the country to grow and be equal to other countries, causing the impact on the ecosystem and the people well-being beyond expectation to cope.

According to the agreement on the belt and road project to connect the transport routes, the dam was built. Dams can be used to generate hydroelectric power by produce electricity from hydropower because some countries are scarce of minerals to generate electricity. Therefore buying fossil fuels from other countries are too expensive and waste of budget causing the country to choose to build a dam instead. Although it takes a long time and requires a very high amount of budget to build, it is considered a one-time waste of money but can be used in the long run. But the problem with dams is that they block waterways, causing distress to nearby communities or people living along the waterfront. Since most of the people in the neighborhood are peasants or fishing, the water obstruction has resulted in the deaths of fish and crops due to inaccessibility of water, resulting in lack of income and starvation. They also had to migrate to other places because their houses blocked the way to build a dam, even though compensation provided, it could not replace the lost income, and if they moved, they would expect a career that would create financial stability for them. Therefore, the government should consider the well-being of the people in the country before the benefits that will be gained from building a dam.
