EE 320 Introductory Mathematical Economics (Section 046402)

Semester 1/2013

Practice Problem 3 (Equilibrium Analysis)

1. (From Tubpun, 2010)

Suppose that the cost function is given by C = 33 + 2Q.

a) If the price per unit is $13, how many units of output should the producer sell in order to breakeven?
b) If the producer produces 20 units of output and sells at $13 per unit, what is the profit obtained by this producer?

2. (From Sydsaeter and Hammond, 2006)

Demand *D* as a function of price *p* is given by $D = \frac{27}{8} - \frac{1}{5}p$. Solve the equation for *p* and find the inverse function.

3. (From Dowling, 2012)

Given the following set of simultaneous equations for two related markets, beef (B) and pork (P):

$Q_{dB} = 82 - 3P_B + P_P$ and $Q_{sB} = -5 + 15P_B$

$Q_{dP} = 92 + 2P_B - 4P_P$ and $Q_{sP} = -6 + 32P_P$

a) What is the relationship between the demand for pork and the demand for beef?
b) Find the equilibrium price and quantity for each market.

4. (Adapted from Sydsaeter and Hammond, 2006)

Consider the demand and supply functions:

$Q_d = 150 - 0.5P$ and $Q_s = 20 + 2P$

a) Find the equilibrium price and the corresponding quantity.
b) Suppose a tax of $2 per unit is imposed on the producer. How will this influence the equilibrium price?
c) Compute the total revenue obtained by the producer before and after the tax in part (b) is imposed.
d) Suppose now that a 20% tax is imposed on the producer. How does this tax affect the equilibrium price and quantity?

5. (Adapted from Tubpun, 2010)

Consider the demand and supply functions of a good:

$Q_d = 260 - 5P$ and $Q_s = -40 + 15P$

a) Find the equilibrium price and the corresponding quantity.
b) In order to encourage the use of this good, the government subsidizes the producers by giving them $4 per unit of the good sold. Find the new equilibrium price and quantity after the government subsidization.
c) Use a graph to illustrate the impact of the subsidization program on the equilibrium price and quantity.
d) Find the amount of money the government needs for this subsidization program.

6. Given a simple macroeconomic model:

$Y = C + I$

$C = 100 + 0.6Y_d$

$I_0 = 40$

$Y_d = Y - T$

a) Suppose T is a lump-sum tax and is equal to 50. Find the equilibrium national income.
b) Suppose T is a proportional tax where $T = 0.04Y$. Find the equilibrium national income.
c) Use graphs to illustrate the difference between the two equilibrium income levels obtained in part a) and part b).

7. Consider the following IS-LM model:

$Y = C + I + G$

$C = 100 + 0.8Y_d$

$I = 80 - 100r$

$G = 100$

$Y_d = Y - T$

$T = 0.25Y$

$M_s = 2500$

$M_d = M_{tp} + M_z$,

$M_{tp} = 0.1Y$

$M_z = 2500 – 150r$

where M_{tp} = transaction-precautionary demand for money and M_z = speculative demand for money

a) Write the IS and LM equations
b) Find the equilibrium national income and rate of interest
c) If the investment function is now $I = 300 - 100r$, find the equilibrium national income and interest rate. Use an IS-LM diagram to illustrate the impact of this change in investment.
d) Suppose that the money supply increases to 2563, find the equilibrium national income and interest rate. Also, use an IS-LM diagram to illustrate the impact of the change in money supply.
