3. Suppose the price elasticity of demand for heating oil is 0.2 in the short run and 0.7 in the long run.
- If the price of heating oil rises from \$1.80 to \$2.20 per gallon, what happens to the quantity of heating oil demanded in the short run? In the long run? (Use the midpoint method in your calculations.)
 - Why might this elasticity depend on the time horizon?

7. Suppose that your demand schedule for pizza is as follows:

Price	Quantity Demanded (income = \$20,000)	Quantity Demanded (income = \$24,000)
\$8	40 pizzas	50 pizzas
10	32	45
12	24	30
14	16	20
16	8	12

- Use the midpoint method to calculate your price elasticity of demand as the price of pizza increases from \$8 to \$10 if (i) your income is \$20,000 and (ii) your income is \$24,000.
- Calculate your income elasticity of demand as your income increases from \$20,000 to \$24,000 if (i) the price is \$12 and (ii) the price is \$16.

3 d) short run (midpoint method)
$$\eta_D = \frac{\text{Percent change in quantity demanded}}{\text{Percent change in price}}$$

$$0.2 = \frac{\% \Delta Q_D}{\frac{(2.2 - 1.8)}{2.2 + 1.8}}$$
$$0.2 = \frac{\% \Delta Q_D}{\frac{0.4}{2}}$$

$$\% \Delta Q_D = 0.04$$

\therefore The quantity demand decrease by 4%. The reason that it decrease due to the law of demand.

Long Run

$$\% \Delta Q_D = \frac{\text{percent change in quantity}}{\text{percent change in price}}$$

$$0.7 = \frac{\% \Delta Q_D}{\frac{(2.2 - 1.8)}{2.2 + 1.8}}$$

$$0.7 = \frac{\% \Delta Q_D}{\frac{0.4}{2}}$$

$$\% \Delta Q_D = 0.14$$

it is decrease by 14%

b) Elasticity depend on time
change. Consumer to find
more or better substitute

7. a) $\eta = \frac{\text{Percent change in } Q_d}{\text{Percent change in } P}$

$$= \frac{32 - 40}{\frac{32 + 40}{2}}$$

$$= \frac{-0.22}{0.22}$$

$$\frac{10 - 8}{\frac{10 + 8}{2}}$$

$= -1$ Ans

$$ii) \textcircled{1} \eta_D \approx \frac{\text{Percent change in } Q_D}{\text{Percent change in } P}$$

$$= \frac{45 - 50}{\left(\frac{45 + 50}{2} \right)}$$

$$\frac{20 - 8}{\left(\frac{10 + 8}{2} \right)}$$

$$= -0.474$$

$$b) i) h_I = \frac{7.000}{1.000}$$

$$= \frac{30 - 24}{24}$$

$$\frac{24,000 - 20,000}{20,000}$$

$$= 1.25 \text{ Ans}$$

$$\text{(ii) } \eta_2 = \frac{100000}{10000}$$

$$= \frac{12-8}{8}$$

$$\frac{24,000 - 20,000}{20,000}$$

$$= 2.5$$
