③

if $n \to \infty$, it will make $q_i = \frac{a}{(n+1)b} \longrightarrow$ nearly zero and each firms will sell at q nearly zero unit #

; it will make $A = nq_i \longrightarrow$ nearly zero. Q of every firms combinded will be nearly $\to \infty$ unit #

; it will make $P = \frac{a}{n+1} \to$ nearly zero. When supply increase, price will decrease $\to$ nearly zero #

; it will make $\pi_i = \frac{a^2}{(n+1)^2 b} - c_i \to -c_i$. Each firm will lose the profit. #

If $n = 1$, it will make $q_i = \frac{a}{(n+1)b} = \frac{a}{2b}$. Since $Q = \frac{a}{2b} < Q = \frac{na}{(n+1)b}$, monopoly will sell less quantity. #

; it will make $A = nq_i = Q$. Since $n = 1$, the firm will be a Monopoly. #

; it will make $P = \frac{a}{n+1} = \frac{a}{2}$. Since $P_M = \frac{a}{2} > P = \frac{a}{n+1}$, Monopoly will set higher price. #

; it will make $\pi_i = \frac{a^2}{(n+1)^2 b} - c_i = \frac{a^2}{4b} - c_i$, which higher than $\pi_i = \frac{a^2}{(n+1)^2 b}$. As a result, the monopoly will get higher profit. #
