

SUMMARY

The Lower Sesan 2 is one of Asia's widest dams and also apart of Chinese government's large scale with a trillion dollar investment. A lot of people consider that whether it was worth the costs after there were thousands of people lost their homes and livelihoods. Moreover, this dam also destroyed both economic and environment at the same time

Whole species of fishes have died because the dam prevents fish from traveling up and down, disrupting their feeding and reproductive cycle which also affects millions of people who live by the Mekong river. All their food and income used to come from fish, vegetables they grew in flood plains along the river and forest products but because if the dam, everything is gone. People are struggle to make a living even though they received some compensation but it didn't match the value of what they lost.

Because of the country's geography is not suited for hydroelectric power, this dam will not only caused environment but also the economic. From all of the disadvantages above, the government needs to provide or create program that give people new skills or explore alternatives energy sources to minimized the harm.
