

**Instructions**

- (1) Please read the instruction carefully.
- (2) Please read each question carefully and answer the questions straightforwardly. Always provide economic reasons at least a paragraph for your analysis, or a graph when necessary, even when the question does not indicate so.
- (3) Handing and submitting assignments are only available via BE Moodle.

**Answering the questions and preparing answer sheets**

- (1) Answers are to be handwritten, in either digital or analog form, in a blank canvas or any clean paper. Make sure that your handwriting is clearly visible and readable.
- (2) There is no need to rewrite the question. Just indicate the question number clearly for each of the answer, such as 1.a).
- (3) Default decimal point is 4.
- (4) Choose precise wordings, especially when you want to interpret the meaning of a test, confidence interval, or coefficients.
- (5) When done, for the digital case, collage all the pages into a single PDF file. For those who write on sheets of paper, take photo of all pages then convert all of them into a single PDF file as well.
- (6) Name your PDF file as StudentID\_YourNickname, such as 640123456\_Bo.

**Submitting your answers**

- (1) Make sure your file does not exceed 10MB. This is the maximum file size for BE Moodle upload.
- (2) Login to BE Moodle, head into the course, then the assignment topic.
- (3) Choose your file to submit. Done. There will be timestamp for your upload date and time, so please make sure to not submit later than that.

**Question 1. (12 points) Economic model of Crime.**

**1.a)** Based on the regression results provided, write out the estimated coefficients in the form of regression equation (1.1). Interpret the estimated coefficients associated with *avgsen*. Based on Model (1.1), test whether the average sentence served from prior convictions has an impact on the number of arrests in the current year (1986). Show your work. (Use  $\alpha = 0.05$ )

**1.b)** What is the overall significance of the regression from Model (1.1) and Model (1.2)? What test do you use? (Use  $\alpha = 0.01$ )

**1.c)** If we are interested in testing whether “ethnic background and legal income” has an impact on the number of arrests in the current year (1986), what kind of null/alternative hypothesis would we be testing? Perform the test and discuss your finding. (Use  $\alpha = 0.05$ )

**Estimate the model (1.1) reports in the Table 1.1**

$$narr86_i = \beta_1 + \beta_2 pcnv_i + \beta_3 avgsen_i + \beta_4 tottime_i + \beta_5 ptime86_i + \beta_6 qemp86_i + u_i \quad (1.1)$$

**Table 1.1**

Source	SS	df	MS	Number of obs	=	2,725
Model	85.9532425	5	17.1906485	F(5, 2719)	=	24.29
Residual	1924.39391	2,719	.707757967	Prob > F	=	0.0000
				R-squared	=	0.0428
				Adj R-squared	=	0.0410
Total	2010.34716	2,724	.738012906	Root MSE	=	.84128

narr86	Coefficient	Std. err.	t	P> t	[95% conf. interval]
pcnv	-.1512246	.040855			Omitted for the purpose of this exam
avgsen	-.0070487	.0124122			
tottime	.0120953	.0095768			
ptime86	-.0392585	.0089166			
qemp86	-.1030909	.0103972			
_cons	.7060607	.0331524			

1a)

$$\text{NarrSB}_i = 0.7060 - 0.1912 \text{pcnr} - 0.0070 \text{avgse} + 0.0120 \\ \text{tottime} - 0.0392 \text{ptimeSB} - 0.2031 \text{qempSB}$$

The equation is in linear model which interpret that

$\beta_{\text{avgse}} = -0.0070$  so if avgse increases by 1 unit,  
NarSB decreases by 0.0070 unit.

$$H_0: \beta_{\text{avgse}} = 0$$

$$H_1: \beta_{\text{avgse}} \neq 0$$

$$\alpha = 0.05$$

$$\alpha/2 = 0.025$$

$$t\text{-cal} = \frac{-0.0070 - 0}{0.0124} = -0.5645$$

$$df = n - k = 2,725 - 6 = 2719$$

$$t\text{-Cri} = -1.960, 1.960$$

$\therefore$  Since  $t\text{-cal}$  does not excess the critical value, we fail to reject null hypothesis ( $H_0$ )

16)

For model 1.1; overall significant can be tested by F-statistic.

$$H_0: \beta_2 = \beta_3 = \beta_4 = \beta_5 = \beta_6 = 0$$

$H_1$ : otherwise

$$\alpha = 0.01$$

$$F\text{-cal} = \frac{R^2 / (k-1)}{(1-R^2) / (n-k)}$$

$$df_1 = k-1 = 6-1 = 5$$

$$df_2 = n-k = 2725 - 6 =$$

$$2719$$

$$= \frac{0.0428 / (6-1)}{(1-0.0428) / (2725-6)}$$

$$F\text{-cri} = 3.02$$

$$= \frac{0.00856}{0.00035}$$

$$= 24.4571$$

$$F\text{-cal} > F\text{-cri}$$

$\therefore$  reject null hypothesis ( $H_0$ )

For model 1.2; overall significant can be tested by  $F$ -statistic.

$$H_0: \beta_2 = \beta_3 = \beta_4 = \beta_5 = \beta_6 = \beta_7 = \beta_8 = \beta_9 = 0$$

$H_1$ : otherwise

$$F\text{-cal} = \frac{R^2 / (k-1)}{(1-R^2) / (n-k)} = \frac{0.0723 / (9-1)}{(1-0.0723) / (2725-9)}$$
$$= 26.4588$$

$$df_1 = k-1 = 9-1 = 8$$

$$df_2 = n-k = 2725-9 = 2716$$

$$F\text{-cri} = 2.91$$

Since  $F\text{-cal} > F\text{-cri}$   
 $\therefore$  we can reject the null hypothesis ( $H_0$ )

1c)

$$H_0: \beta_{\text{Inc 86}} = \beta_{\text{black}} = \beta_{\text{hispan}} = 0$$

$H_1$ : otherwise

$$\alpha = 0.05$$

$$F_{\text{restrict}} = \frac{(R_{\text{unrestrict}}^2 - R_{\text{restrict}}^2) / q}{(1 - R_{\text{unrestrict}}^2) / (n - k_{\text{unrestrict}})}$$

$$df_1 = q = 3$$

$$df_2 = n - k_{\text{unrestrict}} = 2725 - 9$$

$$= 2716$$

$$= \frac{(0.0723 - 0.0428) / 3}{(1 - 0.0723) / (2725 - 9)}$$

$$= \frac{0.0094}{0.00034} = 32.6667$$

$$F_{\text{crit}} = 2.6$$

Since  $F\text{-cal} > F\text{-cri}$ , we reject  
null hypothesis ( $H_0$ ) or restrict model (model 1.1)  
is more preferred.

**Estimate the model (1.2) reports in the Table 1.2**

$$narr86_i = \beta_1 + \beta_2 pcv_i + \beta_3 avgsen_i + \beta_4 tottime_i + \beta_5 ptime86_i + \beta_6 qemp86_i + \beta_4 inc86_i + \beta_5 black_i + \beta_6 hispan_i + u_i \quad (1.2)$$

where

$narr86_i$	= the number of arrests in the current year (1986)
$pcv_i$	= the proportion of prior arrests that led to a conviction
$avgsen_i$	= the average sentence served from prior convictions (in months)
$tottime_i$	= months spent in prison since age 18 prior to 1986
$ptime86_i$	= months spent in prison in 1986
$qemp86_i$	= the number of quarters that the man was legally employed in 1986
$inc86_i$	= legal income, 1986, (hundred dollars)
$black_i$	= 1 if black ethnic background
$hispan_i$	= 1 if Hispanic ethnic background

**Table 1.2**

---

**Question 2. (12 points) Dummy variables and interaction terms.**

Using the Thailand labor force survey (LFS) in quarter 2 of 2019 and 2020, employees log of wage is modeled as follows. (Number of observations is 97,878 in total)

$$\ln wage_i = \beta_1 + \beta_2 civil_i + \beta_3 year_i + \beta_4 civil_i \cdot year_i + u_i$$

where

$\ln wage_i$	= natural logarithmic scale of monthly wage
$civil_i$	= 1; civil servant and state employee = 0; otherwise
$year_i$	= 1; year 2020 = 0; otherwise (2019)

This model is also known as Difference-in-Differences (DiD) and its intention is to capture the effect of COVID-19 since March of 2020 on different types of employment. During the pandemic, we assume that civil servant and state employee's wage is not reduced (control group) while others', namely employees in private firms or freelance, etc., is suspected to be reduced (treatment group). The estimation result is shown below with standard errors in parentheses. Answer the following questions.

$$\ln \widehat{wage}_i = 9.1748 + 0.587 civil_i - 0.0336 year_i + 0.0444 civil_i \cdot year_i + u_i$$

(0.0035)	(0.0072)	(0.005)	(0.0102)
----------	----------	---------	----------

- 2.a)** Test all the parameters **individually** if each of them is significantly different from zero or not.
- 2.b)** How much on average does a civil servant and state employee earn more or less than the others disregarding the year?
- 2.c)** How much on average does the pandemic affect wage overall?
- 2.d)** Are the control group and the treatment group better-off or worse-off during the pandemic. Discuss each group separately, show your work and explain with economic reasons according to the intention of this model.

2a)

t-cal =

- $\beta_1 = 9.1748 / 0.0035$   
 $= 2621.37$

- Civil  
 $= 0.587 / 0.0072$   
 $= 81.5278$

- Year  
 $= -0.0336 / 0.005$   
 $= -6.72$

- Civil \* Year  
 $= 0.0444 / 0.0102$   
 $= 4.35$

$$\alpha = 0.05 \quad \alpha/2 = 0.025$$

$$n = 97,878$$

$$k = 4$$

$$df = n - k$$

$$= 97,878 - 4$$

$$= 97,874$$

$$t\text{-crit} = -1.96, 1.96$$

Since

$$|t\text{-cal}| > |t\text{-crit}| ;$$

all parameter  
are significant

$$2b) \quad \beta_2 = 0.587$$

$$\Delta \text{wage} = 100 \times [e^{0.587} - 1] \\ = 79.86\%$$

$$2c) \quad \beta_3 = -0.0336$$

$$\Delta \text{wage} = 100 \times [e^{-0.0336} - 1] \\ = -3.3042\%$$

The pandemic affect the wage to decrease by 3.3042%.

2d)

① civil + after pandemic      civil = 1, year = 1 (control)

$$\ln \text{wage} = 9.1748 + 0.587(1) - 0.0336(1) + 0.0044(1)(1) = 9.7726$$

② noncivil + after      civil = 0, year = 1 (treatment)

$$\ln \text{wage} = 9.1748 + 0.587(0) - 0.0336(1) + 0.0044(0)(1) \\ = 9.1412$$

$$(1) - (2) = 0,6314$$

$$\Delta \text{wage} = 100(e^{0.6314} - 1) = 88.02\%$$

∴ We can see that the treatment group is worse-off that the wages decrease by 3.3042% which makes an economic sense because in reality, the civil servant's wage will not decrease during the pandemic but the other groups or treatment group will work less which makes their wages decrease.

**Question 3. (8 points) Multicollinearity.**

As cheese ages, several chemical processes take place that determine the taste of the final product. The data given pertain to concentrations of various chemicals in a sample of 30 mature cheddar cheeses and subjective measure of taste for each sample.

**Estimate the model (3.1) reports in the Table 3.1**

$$Taste = \beta_0 + \beta_1 acetic + \beta_2 h2s + \beta_3 lactic + u \tag{3.1}$$

- Where
- Taste* = Measures of taste for each sample
  - acetic* = The natural logarithm of concentration of acetic
  - h2s* = The natural logarithm of concentration of hydrogen sulfide
  - lactic* = Lactic

**Table 3.1**

**3.a)** Is there evidence of multicollinearity in the data? How do you know? Explain your answers in detail and state the critical value for hypothesis testing to receive full points.

**3.b)** What is the property of BLUE? If there is the multicollinearity problem, is the OLS estimators still retain the property of BLUE? If not, which properties are violated?

**Question 4. (8 points) Heteroscedasticity.**

The data on U.S. inflation rates (%) and unemployment rates (%), 1948-2006

Estimate the model (4.1) reports in the Table 4.1

$$Inf_t = \beta_1 + \beta_2 unem_t + u_t \tag{4.1}$$

where  $Inf_t$  = inflation rates (%)

$unem_t$  = unemployment rates (%)

**Table 4.1**

Source	SS	df	MS	Number of obs	=	59
Model	32.3284496	1	32.3284496	F(1, 57)	=	3.85
Residual	478.096987	57	8.38766644	Prob > F	=	0.0545
Total	510.425437	58	8.80043856	R-squared	=	0.0633
				Adj R-squared	=	0.0469
				Root MSE	=	2.8961

inf	Coefficient	Std. err.	t	P> t	[95% conf. interval]
unem	.5054734	.2574699			
_cons	1.010847	1.491583			

White's general test statistic: 1.0266 Chi-sq (2)

Breusch-Pagan / Cook-Weisberg test for heteroskedasticity

$$chi2(1) = 1.12$$

3a)  $H_0$  : no multicollinearity

$H_1$  : multicollinearity

VIF critical = 5

According to the table, each data of VIF is less than 5 so we accept  $H_0$  or which means there is no multicollinearity.

3 b) The property of BLUE includes ; (1) Unbias  $E(\hat{\beta}) = \beta$   
(2) consistency  $\lim_{n \rightarrow \infty} \hat{\beta} = \beta$ , (3) efficiency min variance.

BLUE has nothing to do with multicollinearity problem so the OLS estimators will still retain the property of BLUE.

---

Answer the following questions.

**4.a)** Interpret the intercept and slope coefficients.

**4.b)** According to the test statistics given after Table 4.1 below, is there any sufficient evidence to conclude that there is heteroscedasticity problem? Show your work on the hypothesis testing. (Use  $\alpha = 0.05$ )

**4.c)** Given your test results in a), do the OLS estimators still retain the property of BLUE? If not, which properties are violated?

\*\*\*\*\*

4a)  $\beta_1$ : When the unemployment rate is equal to 0, the inflation rate will equal to 1.01 unit on average.

$\beta_2$ : When the unemployment rate increases by 1%, the inflation rate will increase by 0.5055% on average.

4b)

$H_0$ : Homoscedasticity

$H_1$ : Heteroscedasticity

$$\alpha = 0.05$$

$$LM = n \cdot R^2 = 1.0266$$

$$df = 2$$

$$\chi^2 = 5.9915$$

$\therefore$  Since  $\chi^2 > LM\text{-cal}$   
we fail to reject  
the null hypothesis ( $H_0$ )  
or it means there is  
no heteroscedasticity problem.

4 c)

According to 4 b), we fail to reject the null hypothesis so that we can assure that the property of BLUE will not be violated.
