

## HW#5 Due September 22, 2020

### Mankiw Page 107

3. Suppose the price elasticity of demand for heating oil is 0.2 in the short run and 0.7 in the long run.
- If the price of heating oil rises from \$1.80 to \$2.20 per gallon, what happens to the quantity of heating oil demanded in the short run? In the long run? (Use the midpoint method in your calculations.)
  - Why might this elasticity depend on the time horizon?

7. Suppose that your demand schedule for pizza is as follows:

Price	Quantity Demanded (income = \$20,000)	Quantity Demanded (income = \$24,000)
\$8	40 pizzas	50 pizzas
10	32	45
12	24	30
14	16	20
16	8	12

- Use the midpoint method to calculate your price elasticity of demand as the price of pizza increases from \$8 to \$10 if (i) your income is \$20,000 and (ii) your income is \$24,000.
- Calculate your income elasticity of demand as your income increases from \$20,000 to \$24,000 if (i) the price is \$12 and (ii) the price is \$16.

3. Suppose the price elasticity of demand for heating oil is 0.2 in the short run and 0.7 in the long run.

- If the price of heating oil rises from \$1.80 to \$2.20 per gallon, what happens to the quantity of heating oil demanded in the short run? In the long run? (Use the midpoint method in your calculations.)
- Why might this elasticity depend on the time horizon?

$$a.) \quad \eta_D = \frac{\% \Delta Q_D}{\% \Delta P}$$

$$0.2 = \frac{\% \Delta Q_D}{\frac{2.2 - 1.8}{1.8} \times 100} \quad \rightarrow \quad 0.2 = \frac{\% \Delta Q_D}{22}$$

$$\therefore \% \Delta Q_D = 4.4 \quad \#$$

(short)

$$0.7 \times 22 = 1.54 \quad \#$$

(long)

b) Short run

can not change because  
enough time long run can  
change everything ~~is~~

7. Suppose that your demand schedule for pizza is as follows:

Price	Quantity Demanded (income = \$20,000)	Quantity Demanded (income = \$24,000)
\$8	40 pizzas	50 pizzas
10	32	45
12	24	30
14	16	20
16	8	12

$$\frac{\Delta Q}{Q} = \frac{10-8}{32-40} = -\frac{2}{8} = -\frac{1}{4}$$

- Use the midpoint method to calculate your price elasticity of demand as the price of pizza increases from \$8 to \$10 if (i) your income is \$20,000 and (ii) your income is \$24,000.
- Calculate your income elasticity of demand as your income increases from \$20,000 to \$24,000 if (i) the price is \$12 and (ii) the price is \$16.

$$\eta_s = \frac{\% \Delta Q_s}{\% \Delta P}$$

$$\frac{2}{-5}$$

a.)  $\eta_D = \frac{\% \Delta Q_s}{\% \Delta P}$  At 20,000

Sol  $\eta_s = \frac{(Q_1 - Q_0) / (Q_1 + Q_0)}{(P_1 - P_0) / (P_1 + P_0)}$

$$\eta_s = \frac{1}{\text{slope}} \cdot \frac{(P_1 + P_0)}{(Q_1 + Q_0)}$$

$$\eta_s = \frac{1}{-\frac{1}{4}} \cdot \frac{(10+8)}{(32+40)} = -4 \cdot \frac{18}{72}$$

$$= 1 \neq$$

At 24,000

Sol  $\eta_s = \frac{1}{\text{slope}} \cdot \frac{(P_1 + P_0)}{(Q_1 + Q_0)}$

$$= \frac{1}{-\frac{2}{5}} \cdot \frac{8+10}{45}$$

$$\eta_s = -\frac{5}{2} \cdot \frac{18}{45}$$

$$= -0.47 \neq$$

7. Suppose that your demand schedule for pizza is as follows:

Price	Quantity Demanded (income = \$20,000)	Quantity Demanded (income = \$24,000)
\$8	40 pizzas	50 pizzas
10	32	45
12	24	30
14	16	20
16	8	12

- a. Use the midpoint method to calculate your price elasticity of demand as the price of pizza increases from \$8 to \$10 if (i) your income is \$20,000 and (ii) your income is \$24,000.
- b. Calculate your income elasticity of demand as your income increases from \$20,000 to \$24,000 if (i) the price is \$12 and (ii) the price is \$16.

$$\frac{16-12}{8-24} =$$

$$\frac{4}{-16} = \frac{1}{-4}$$

b.)

$$\eta_I = \frac{\% \Delta Q_D}{\% \Delta I}$$

$$= \frac{\frac{30 - 24}{24} \times 100}{\frac{24,000 - 20,000}{20,000} \times 100}$$

$$= \frac{25}{20}$$

$$= 1.25 \#$$

$$\eta_I = \frac{\% \Delta Q_D}{\% \Delta I}$$

$$= \frac{\frac{12 - 8}{8} \times 100}{\frac{24,000 - 20,000}{20,000} \times 100}$$

$$= \frac{50}{20}$$

$$= 2.5 \#$$
