

INCOME INEQUALITY IN THAILAND

Bhanupong
Lecture 28

Outline

1. Complex relationship: Income inequality, poverty, and growth
2. Kuznets hypothesis: A trickle down effect of growth?
3. Causes of widening wealth gap
4. Financial inclusion: A silver bullet?

1. Poverty-growth-inequality triangle

Complex relationship

Growth

Inequality

Poverty

Implication of globalization

- Prices of domestic goods cannot significantly deviate from the international prices (traded goods or manufactured).
- In the long run, the law of one price states that the prices of traded goods are dictated by the international prices.
- Fluctuations in prices of traded goods affect values of marginal products of factors of production and the overall income distribution.

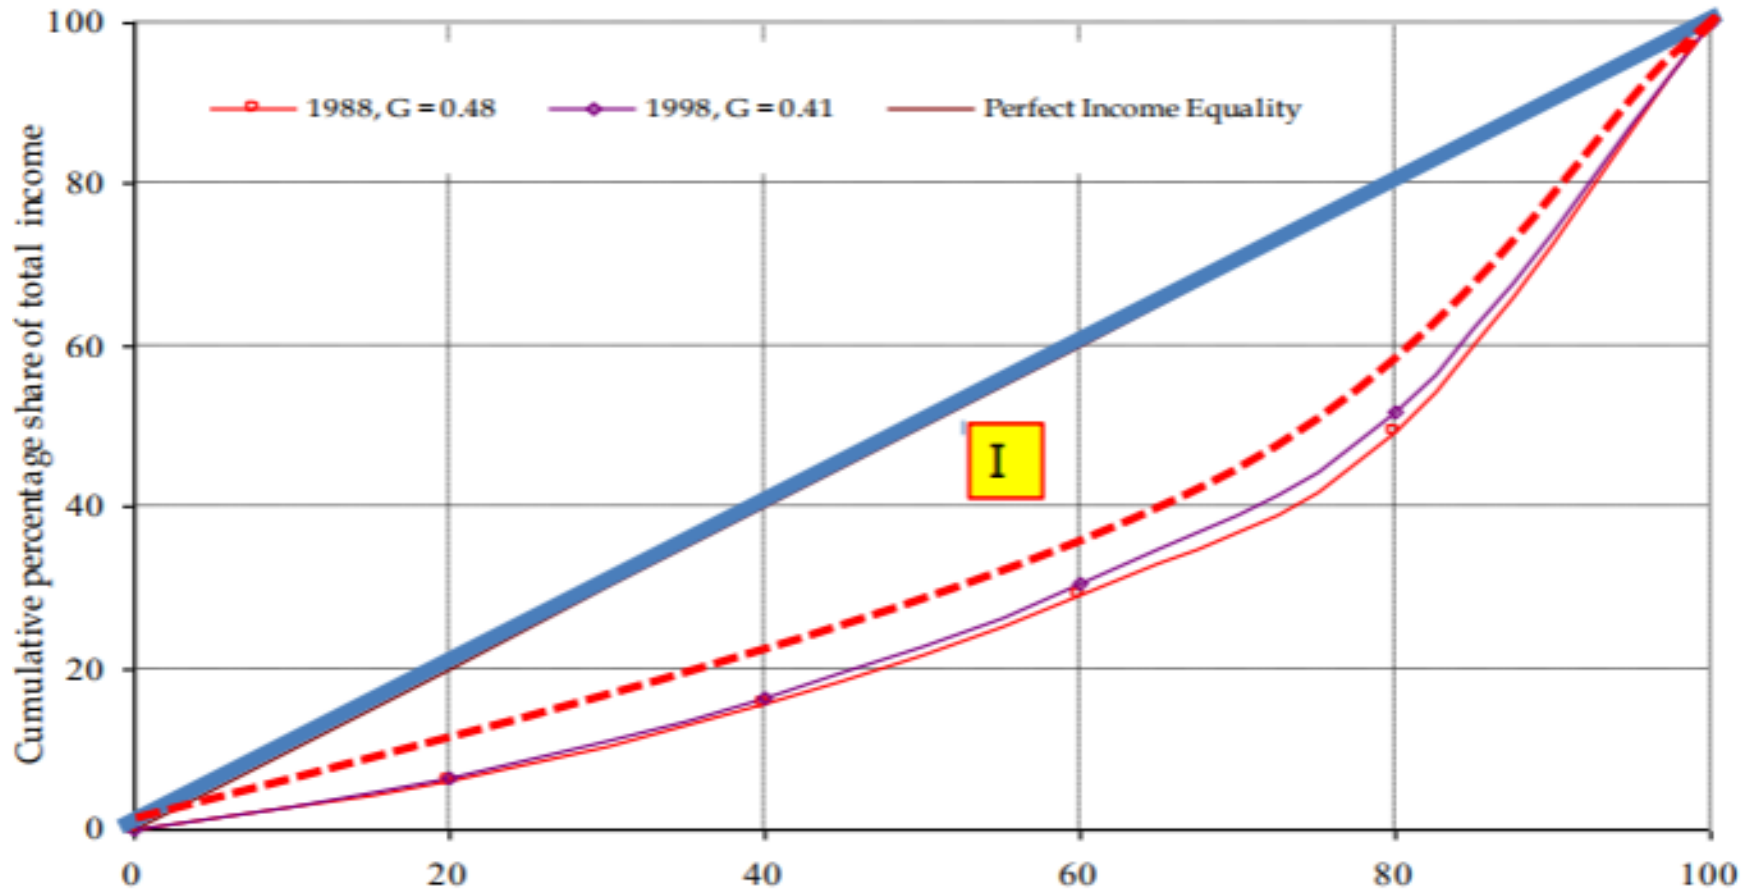

Agricultural labor income share

- The agricultural share of employment is declining relative to other sectors.
- The wage share of labor in the agricultural sector will be lower if the marginal product of other sectors rises faster than that of agricultural labors.
- If the terms of trade of agricultural goods to manufactured goods declines, income inequality will increase.

The Gini Coefficient: Measurement of income inequality

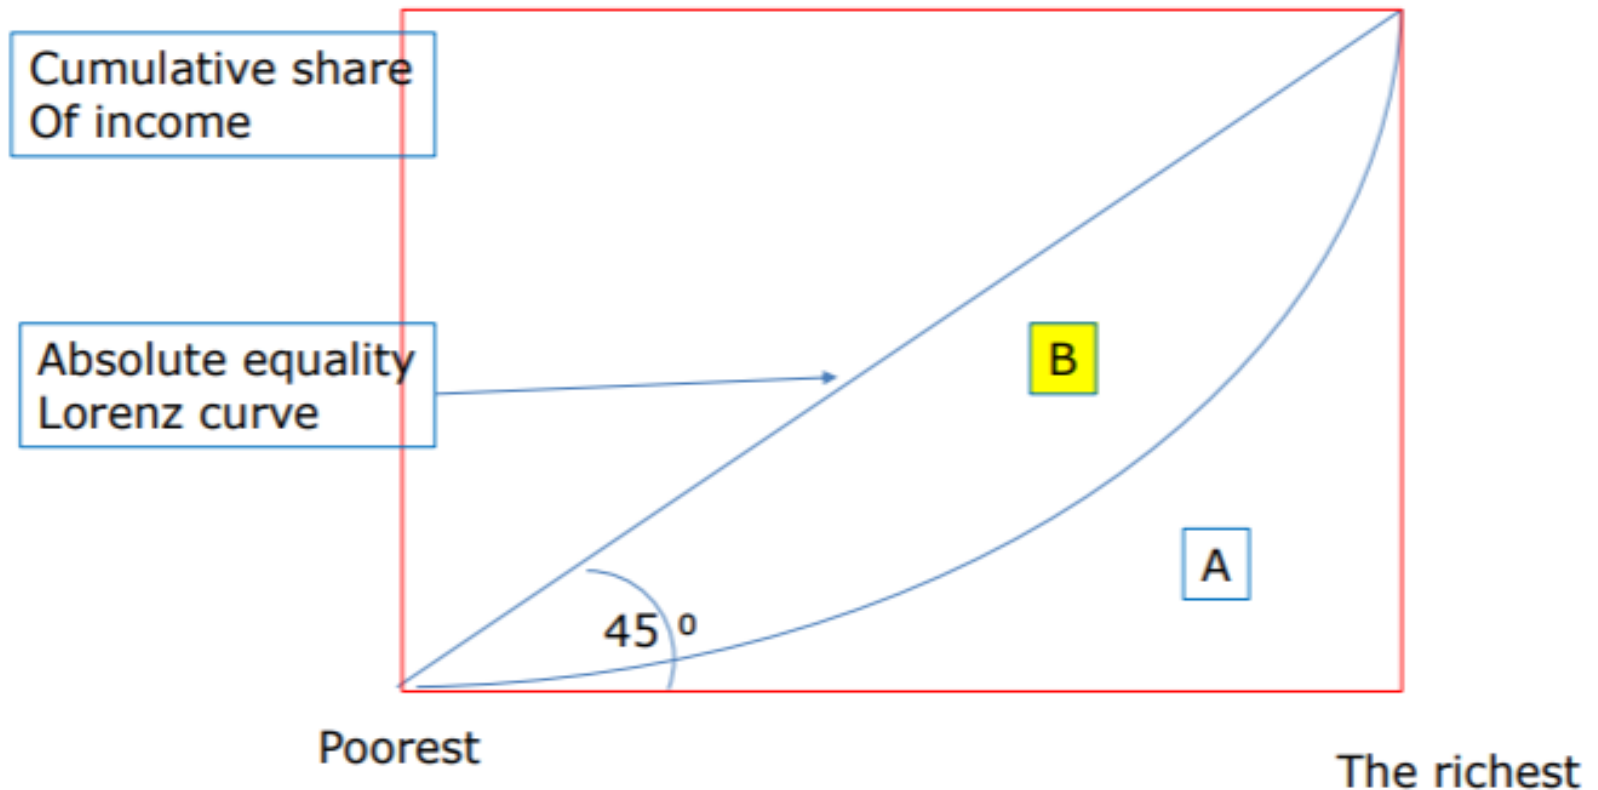

- The Gini coefficient is a measurement of inequality; its value ranges between zero and one.
- The higher the value of the Gini, the higher the degree of income inequality.
- Perfect equality, when the Gini is zero, may not be desirable, because efficiency will be threatened.
- At zero value of Gini, x % of the poorest will obtain x % of total income.

The Lorenz curves: 1988 (0.48) vs. 1998 (0.41)

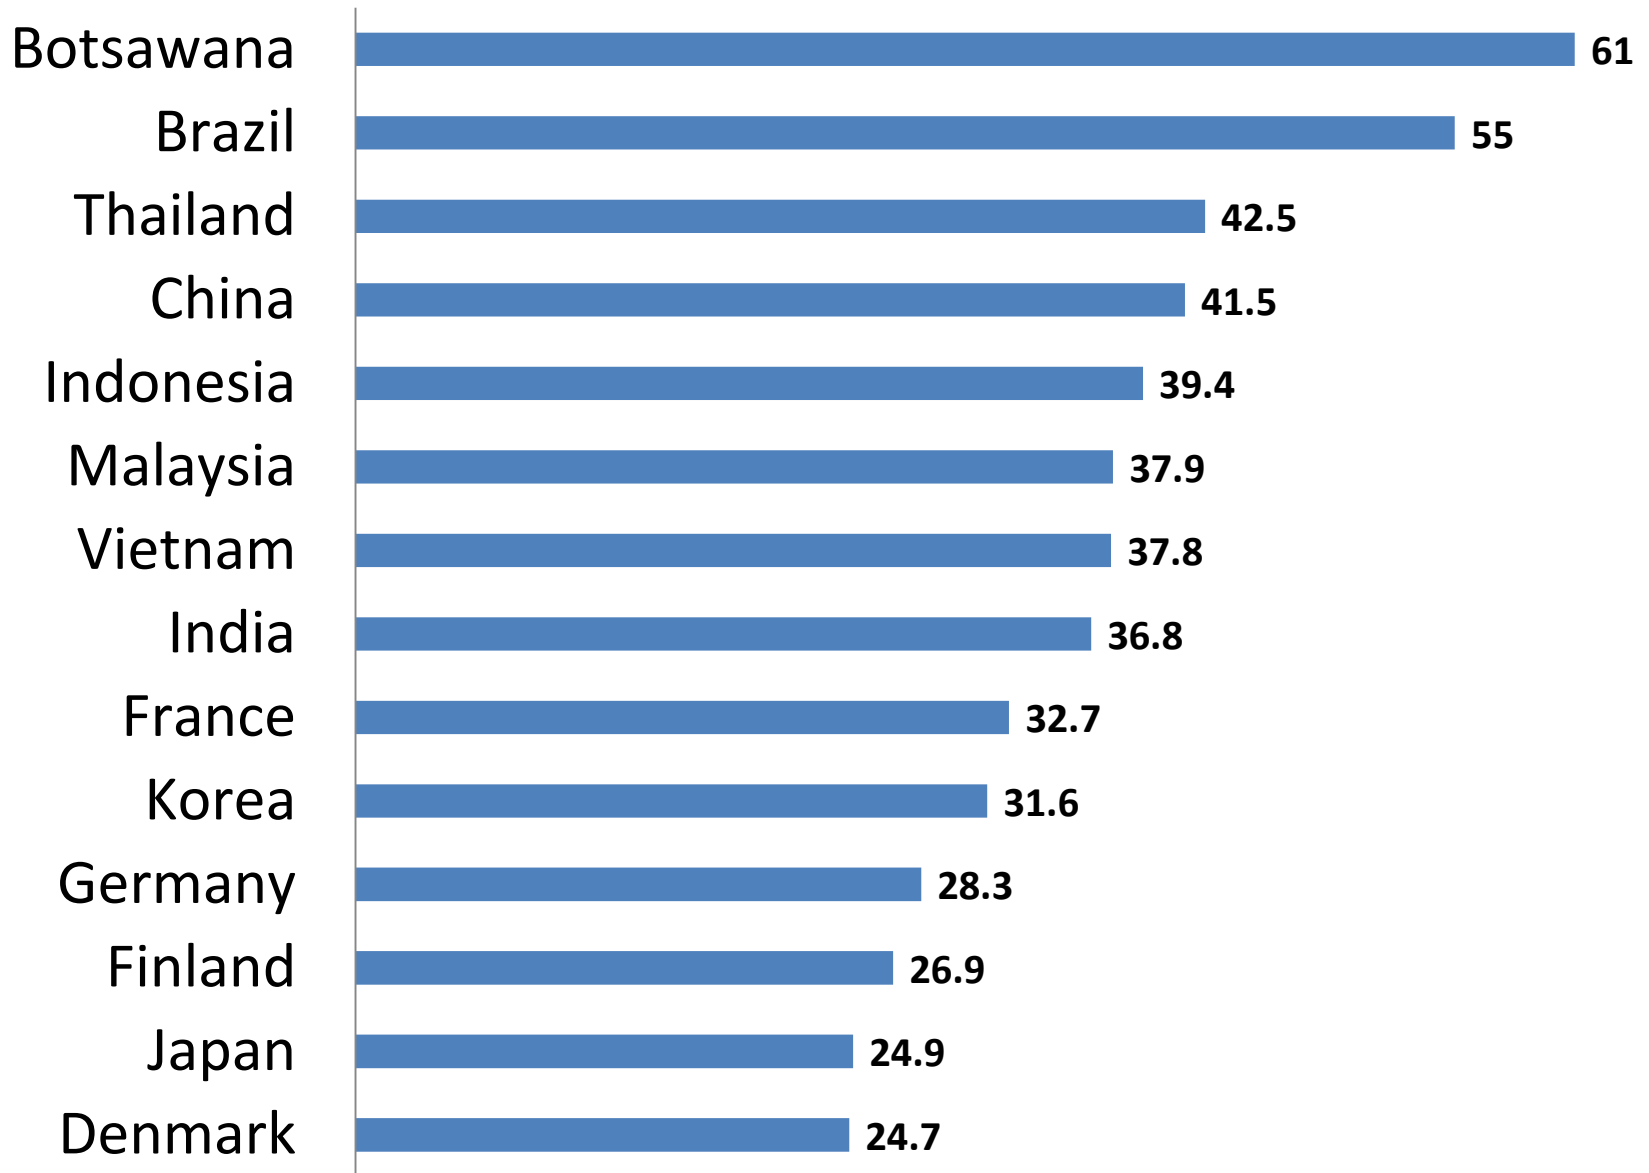

Perfect equality: $B = 0$

$$\text{Gini} = B / (B + A)$$

Gini coefficient: 1992-2007

How far can we trust the Gini?

- The Gini index is *sensitive* to the changes in the **middle of the earnings** distribution rather than the tails.
- Two different Lorenz curves with different shapes can yield the same Gini coefficient.
- *Gross income*, rather than net income, is used; thereby excluding taxation and transfer money payments.
- Underlying household surveys differ in method and in the type of data collected, the distribution data are not strictly comparable across countries.
- We must take into account of any major event affecting *transitory income* that might create distortions to the computation of income.

Measurement errors

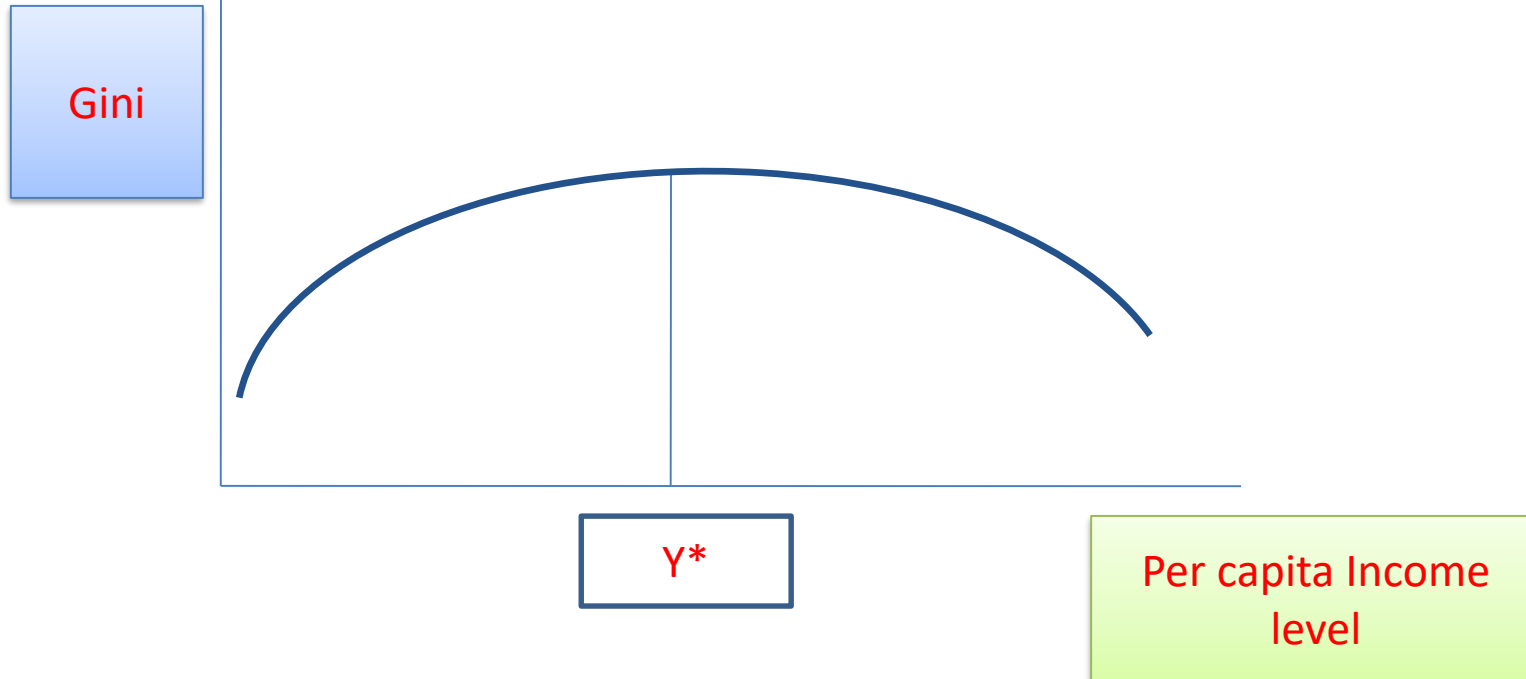

- Note that the measurements of inequality and poverty are based on estimated **monetary** income.
- Income inequality **does not** deal with the issue of **quality of life, but** income is the best available measure of poverty.
- **Non-monetary indicators** of poverty are: infant mortality, child and adult death, literacy, and school enrollment, life expectancy, availability of safe water and medical services, caloric and protein intake.

Inequality in China and India

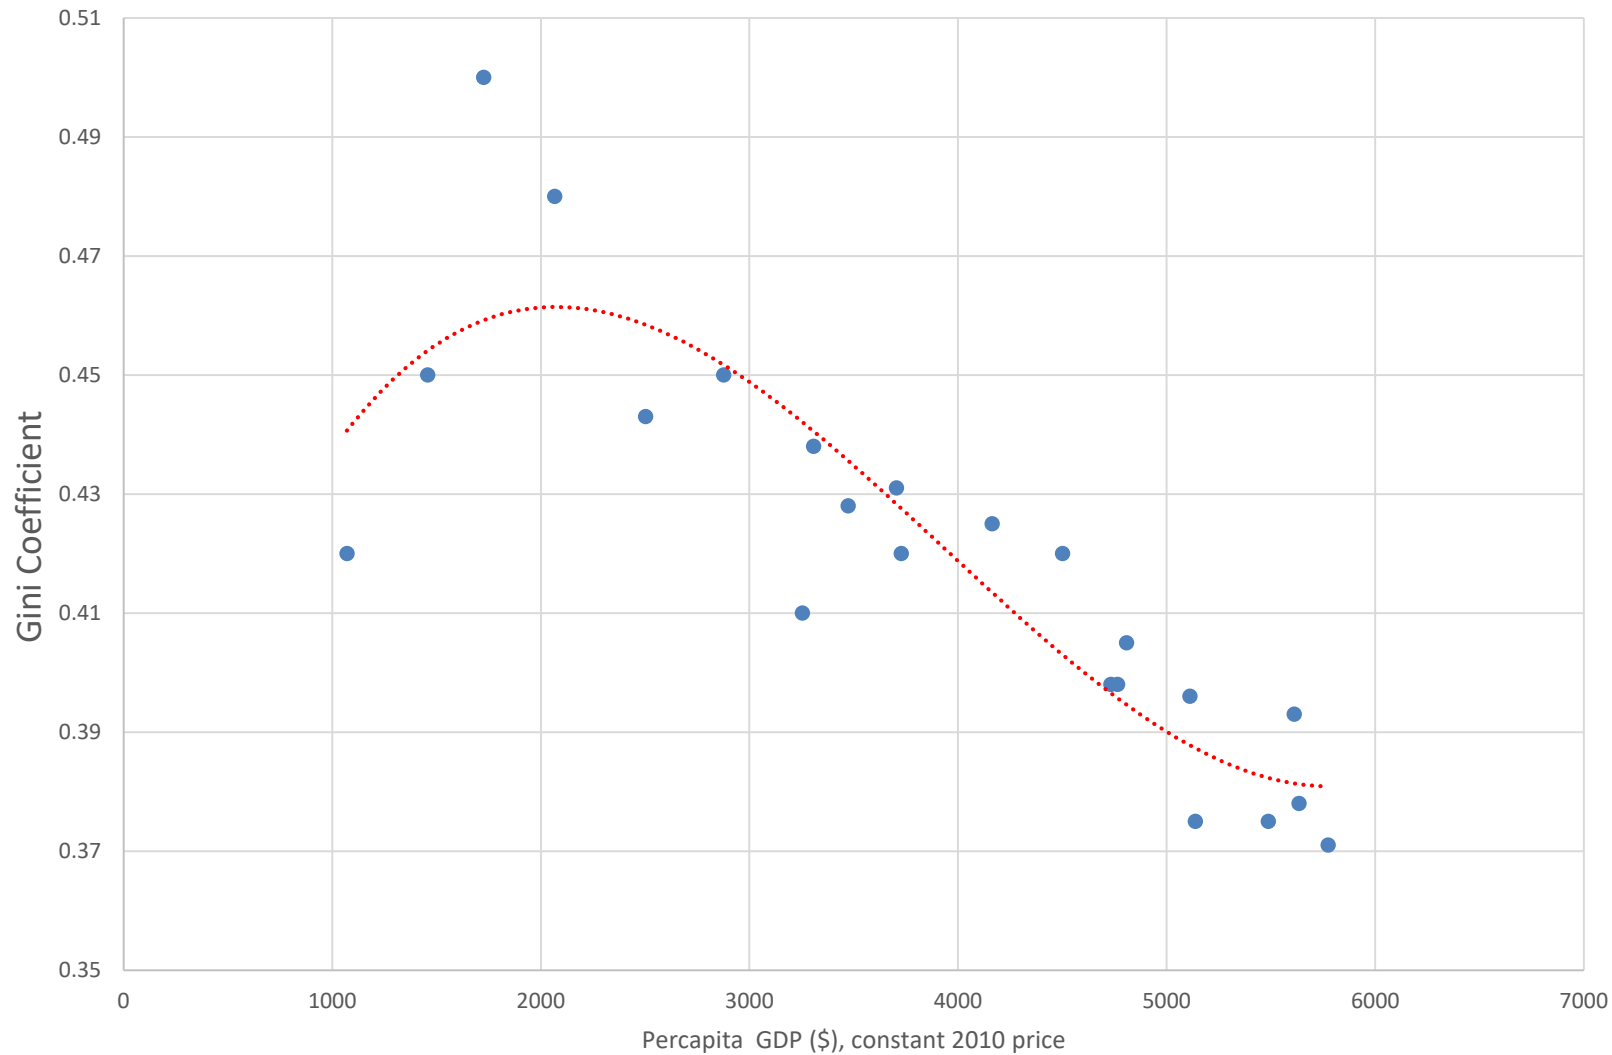

- There are 36 billionaires in India, according to the annual Forbes list of the world's richest people in Asia (Japan fell to No. 2 for the first time in two decades).
- While 850 million Indians are living on \$2 or less a day.
- Large income inequality exists in the fast growing economies like China and India (evidence supporting the Kuznets hypothesis)

2. Kuznets hypothesis

The empirical evidence on the Kuznets hypothesis is far from conclusive. The inverted U-shaped curve cannot properly capture the intricate relationship between income and inequality.

Thailand's Kuznets Curve: 1975-2015

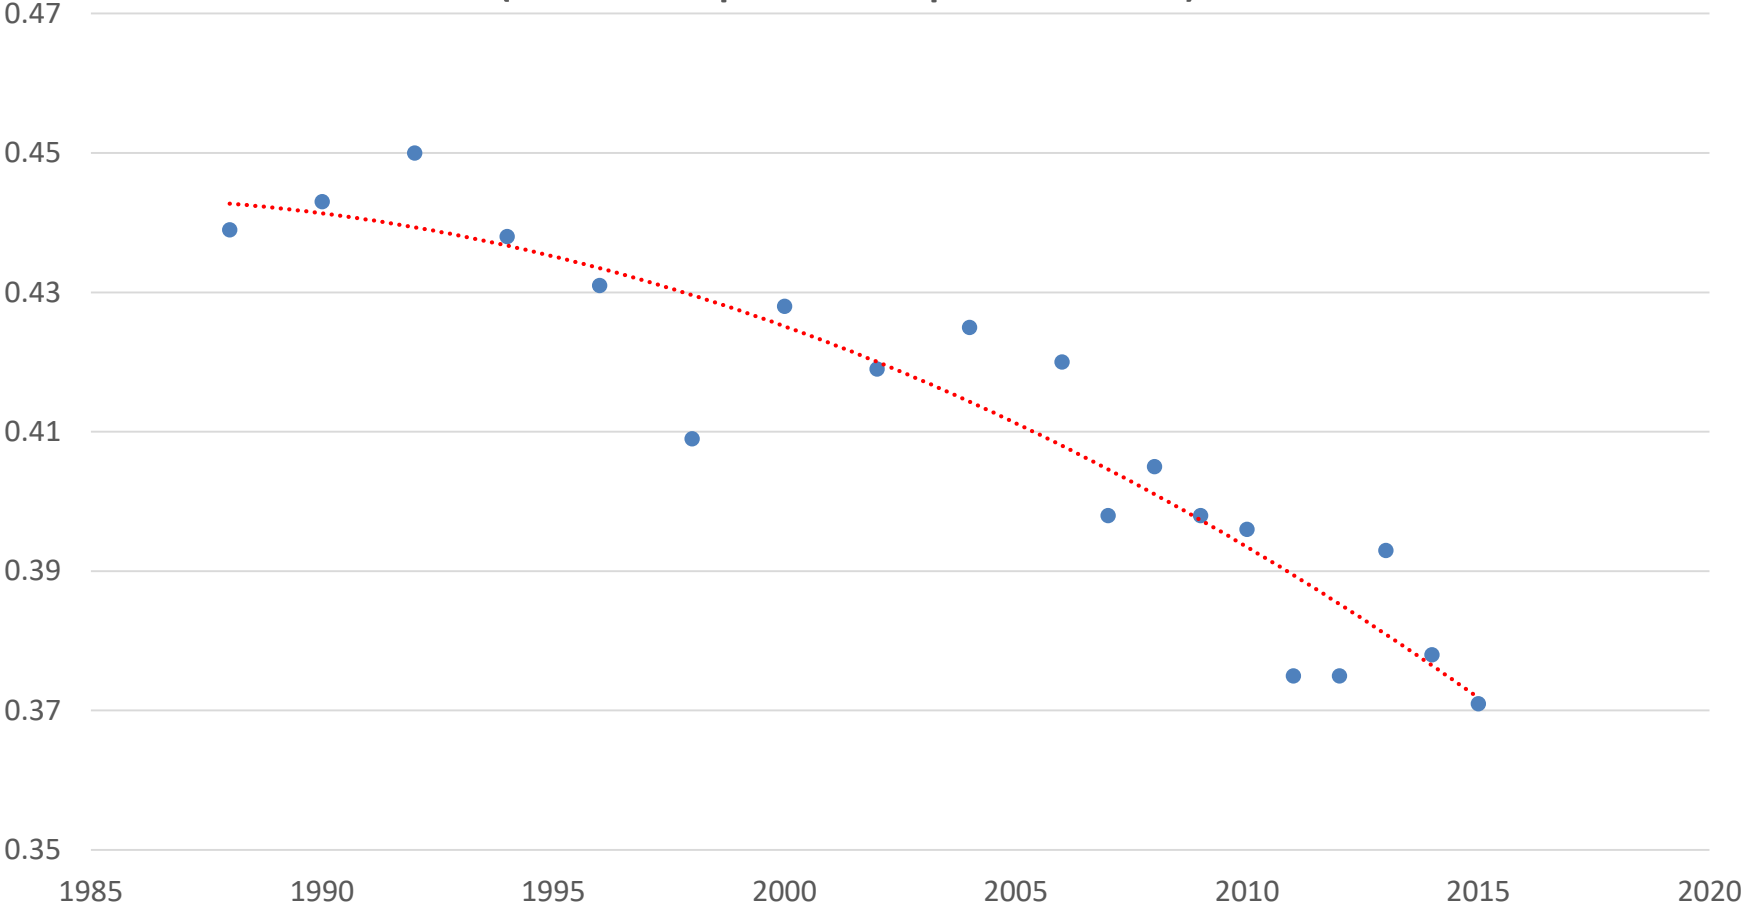

Not a simple relationship between income and inequality

- Kutznets (1955) hypothesis states that income inequality widens in the early stage of development and narrows in later stage when income rises above certain threshold levels.
- *“Income distribution must get worse before it gets better.”*
- Developing countries had greater equality in their **early** stages of development because everyone was thought to be more or less equally poor.

What the Gini does not tell

- Income measures may not adequately capture informal sector income, value of food *grown and consumed* by the family, and other economic activity that goes unreported or unestimated (the underground economy)
- **The positive relationship between equality and growth (when per capita income is above the threshold level) does not imply that “soak the rich” policies will improve long-term growth.**
- **How about measuring inequality by expenditures rather than income?**

Declining inequality Gini Coefficient (consumption expenditure)

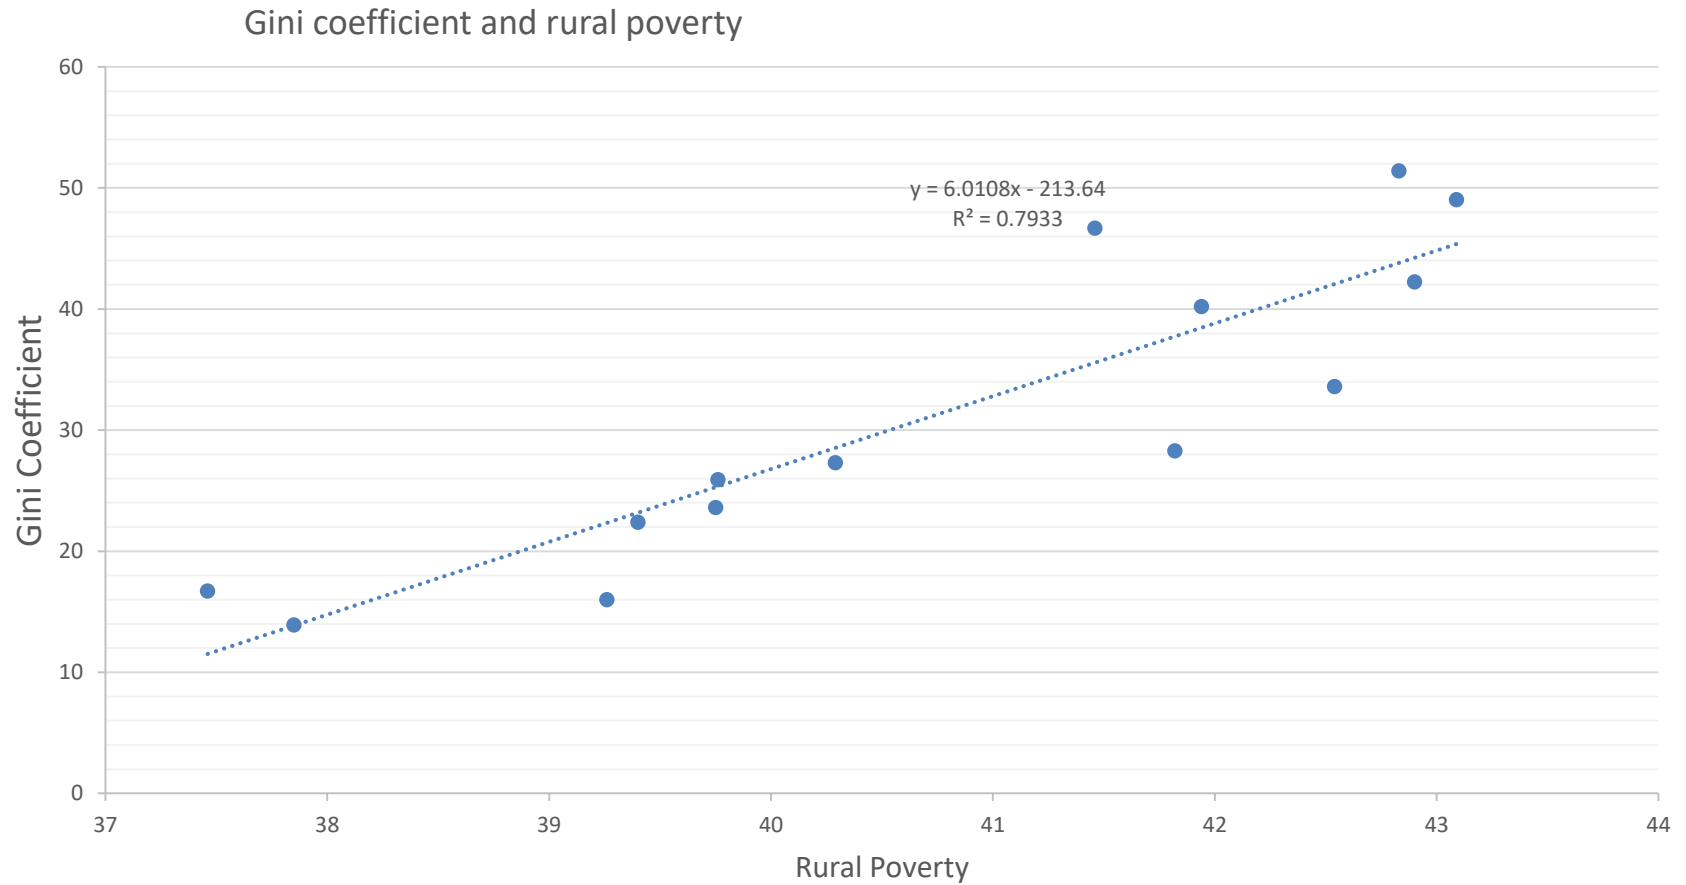

Should we tax the rich?

- Policies designed to decrease inequality may increase government consumption, and the cost of the greater government consumption *may outweigh* the benefits of greater equality.
- If per capita income is below the threshold level, a higher level of inequality is not a necessary precondition for growth.
- How did Korea and Taiwan manage their income equality so well?

Has Thailand's economic development led to rising income inequality?

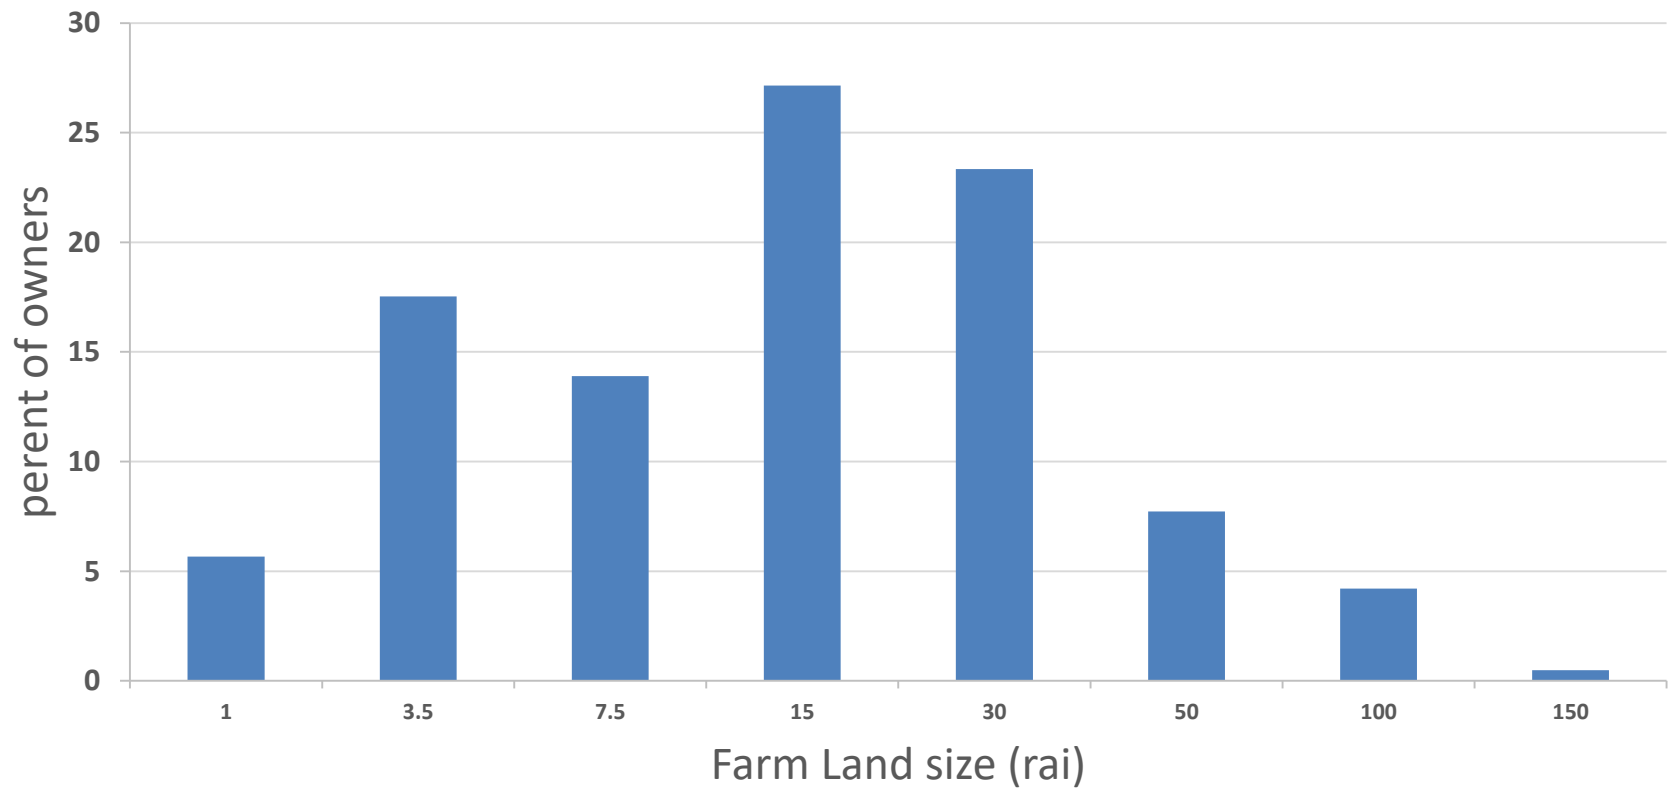

- It is premature to say that Thailand's market friendly development policy has increased income inequality, as argued by critiques of globalization.

Inequality can be attributed to rural poverty

Income inequality is related to **asset inequality**

Land holding inequality

Kirimaya Residence at Khow Yai

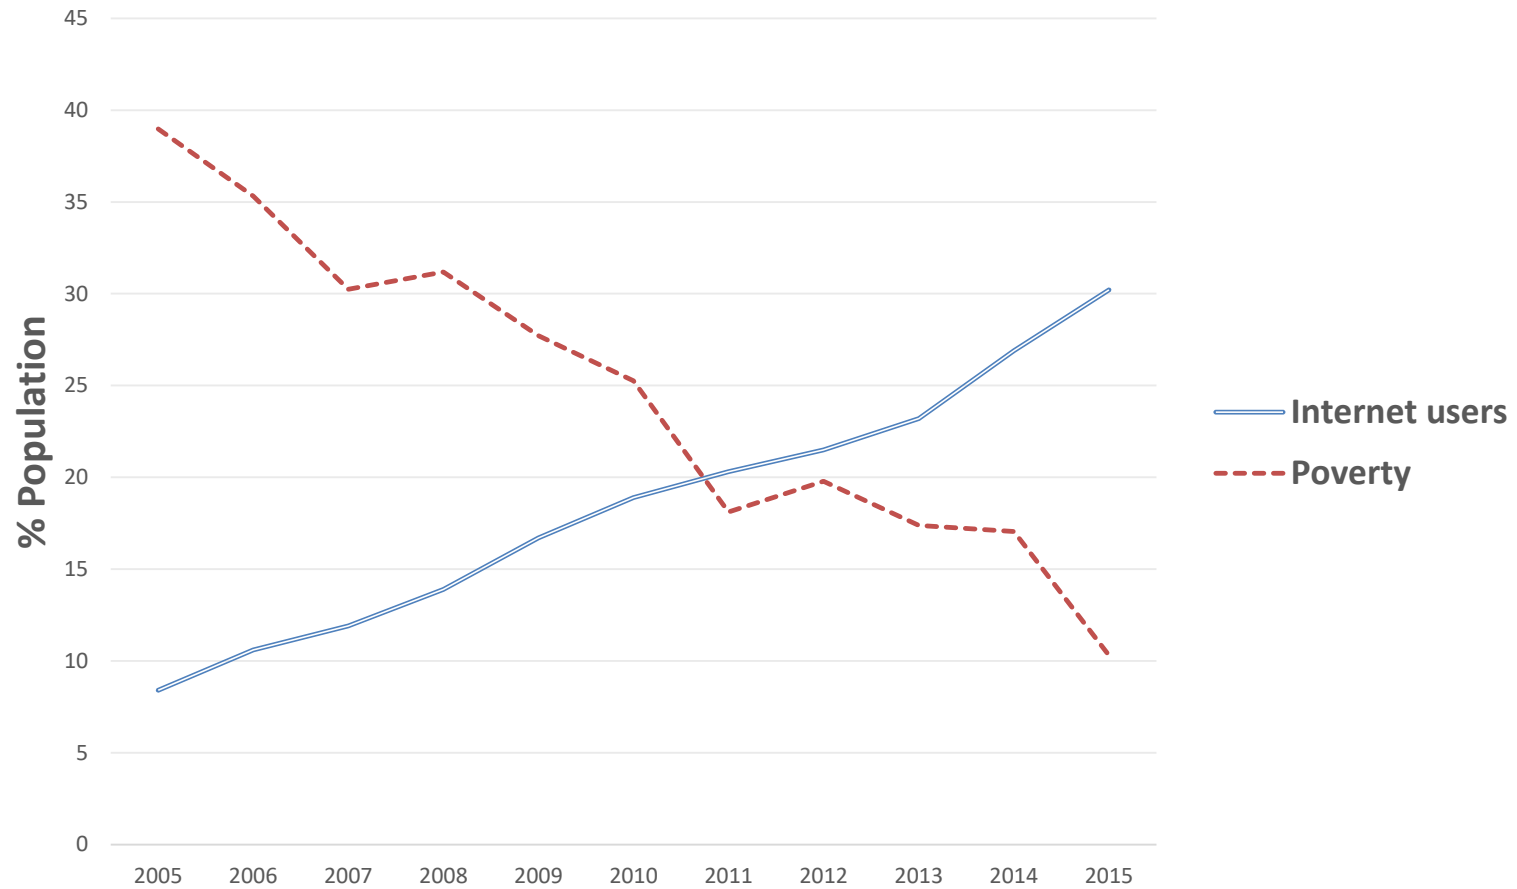

A 300 million baht apartment

The price would go up to a million baht per square meter (soon)

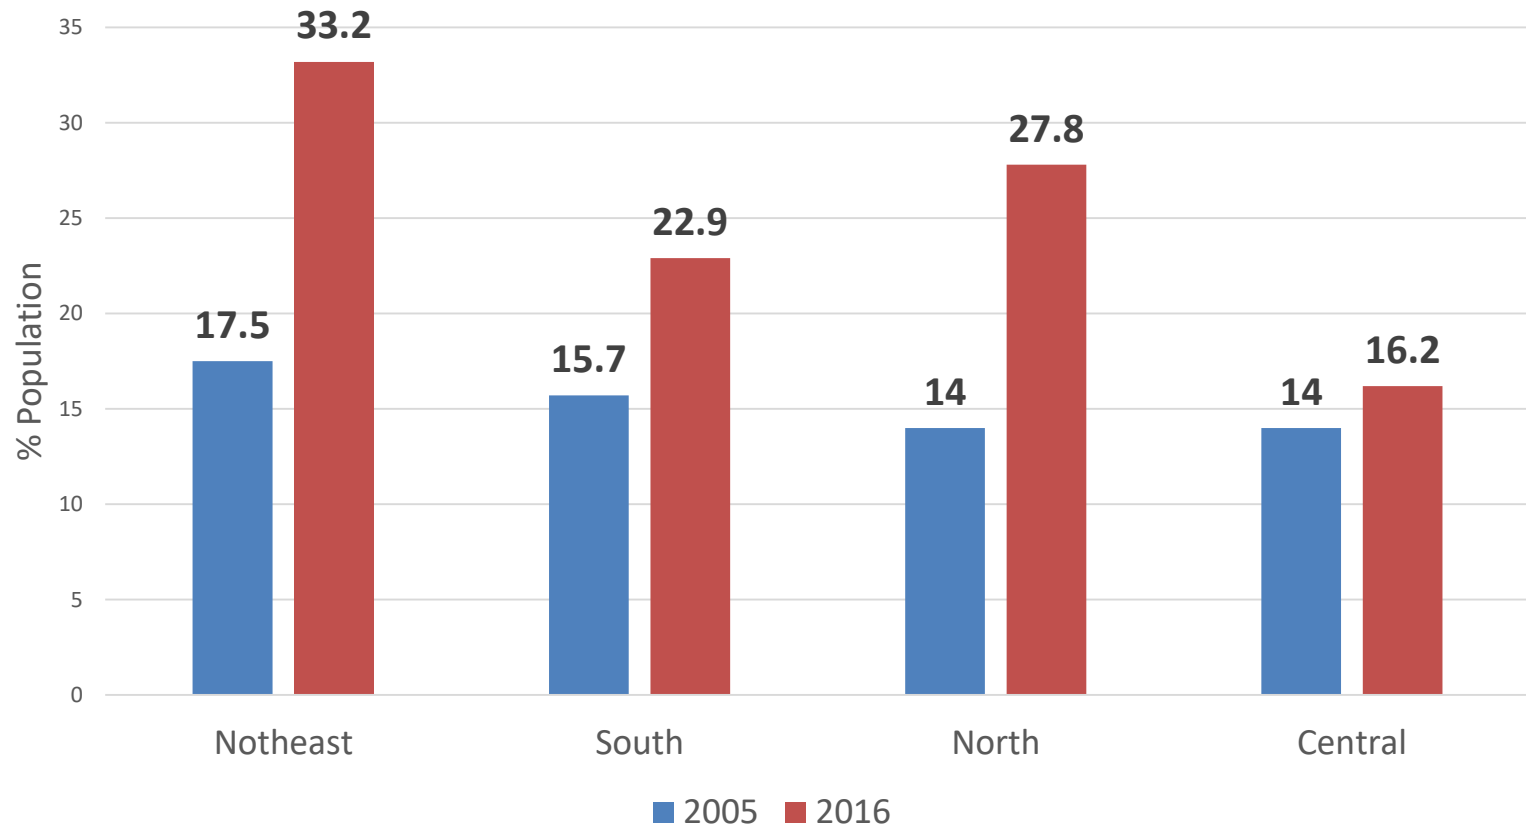

Internet Access and Poverty: Northeast

Digital Divide

Regional differences from Bangkok Internet Users

3. Factors contributing to income inequality

- Inequality in access to education
- Increased poverty
- Slowdown in economic growth
- Rising unemployment and underemployment
- Deteriorating terms of trade of agricultural prices
- Financial exclusion

Severe inequality can cause a vicious circle of slower economic growth

Mincer earnings function

Jacob Mincer (JPE 1958)

- The Mincer earnings function is a single-equation model that explains wage income as a function of schooling and experience

$$\ln W = \ln W_0 + \rho S + \beta_1 X + \beta_2 X^2$$

W_0 = wage with no education and working experien

S = *number of years of schooling*

X = years of experience

ρ and β_1, β_2 are the returns to schooling and experience

Note the quadratic function

Neoclassical theory of wage

- The wage rate is determined by the value of marginal product of labor in the competitive market.
- The demand for labor is the derived demand from the goods produced by the labor.
- The higher the marginal productivity of labor, the higher the real wage rate.

$$\text{Wages} = (\text{MP}_L) \times \text{Prices}$$

- Income distribution between farmers in rural and labors in urban areas depends partly on relative marginal productivity as well as relative prices of the products they produce.
- Marginal productivity of each industry depends on the capital-labor ratio employed in each sector.
- The changing terms of trade among sectors also determine income distribution.

Productivity differences and the terms of trade between sectors affect income distribution

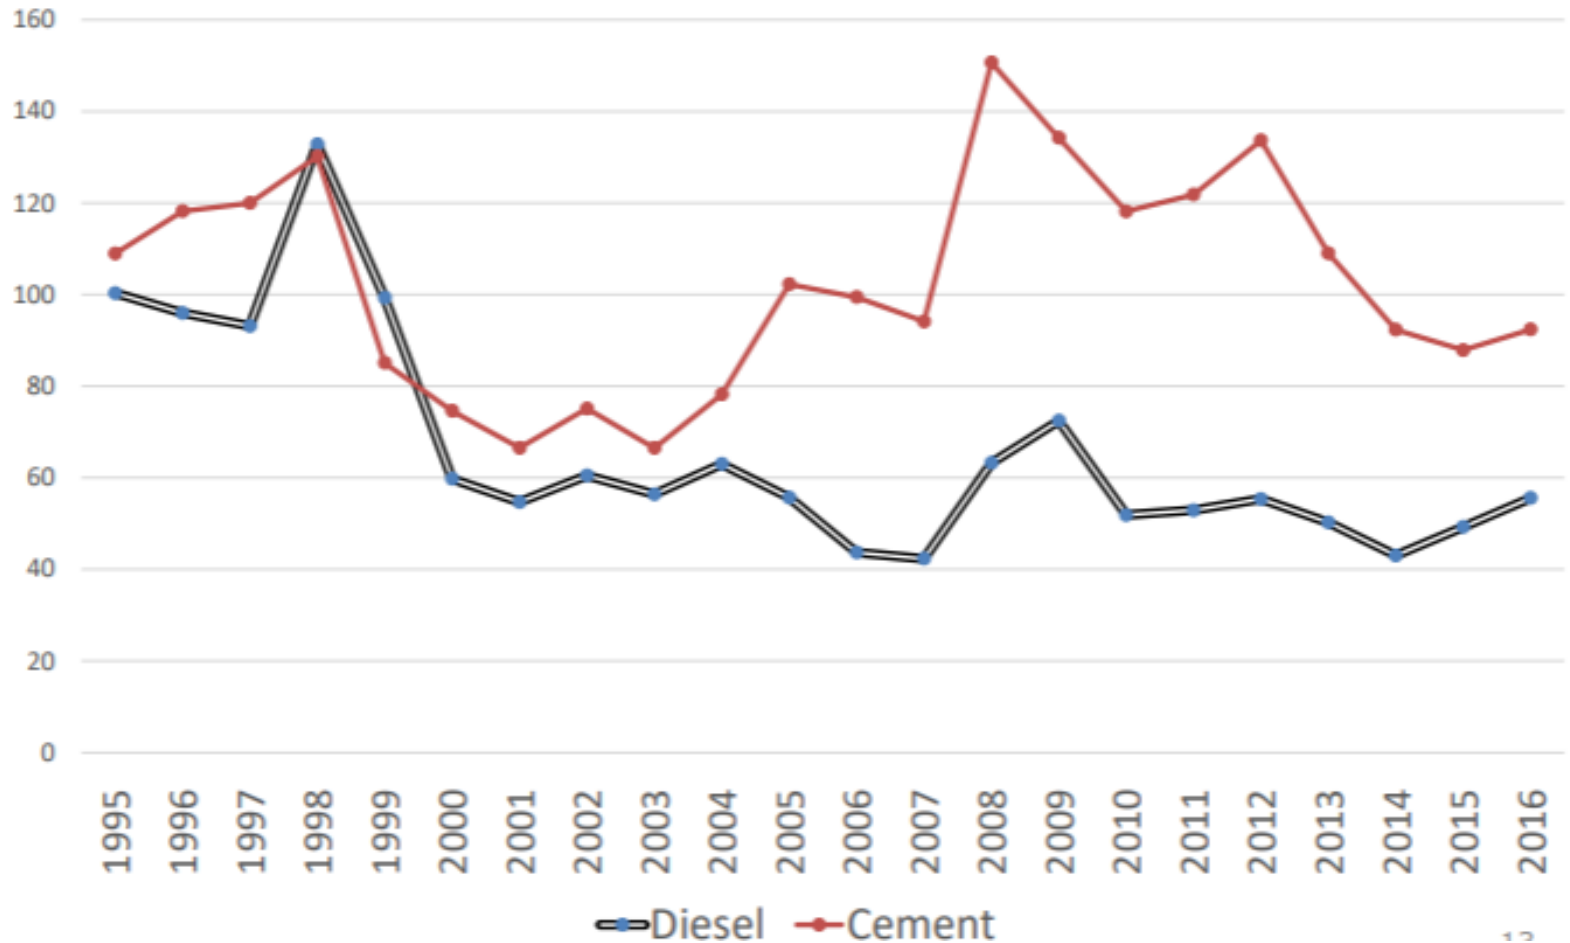

$$\frac{W_M L_M}{W_A L_A} = \text{relative income share between two sectors}$$
$$\frac{(MP_L^M P_M) L_M}{(MP_L^A P_A) L_A} = \left(\frac{MP_L^M}{MP_L^A}\right) \left(\frac{P_M}{P_A}\right) \left(\frac{L_M}{L_A}\right)$$

Marginal productivity of labor depends on capital labor ratio

Level of education attainment is related to labor productivity

Terms of Trade

Rice vs. Manufactured Products

Nutrition is a key factor in development of children intelligence

Brain food: Nutrition is a key factor in the development of children's intelligence. PHOTO: Jetjaras na Ranong

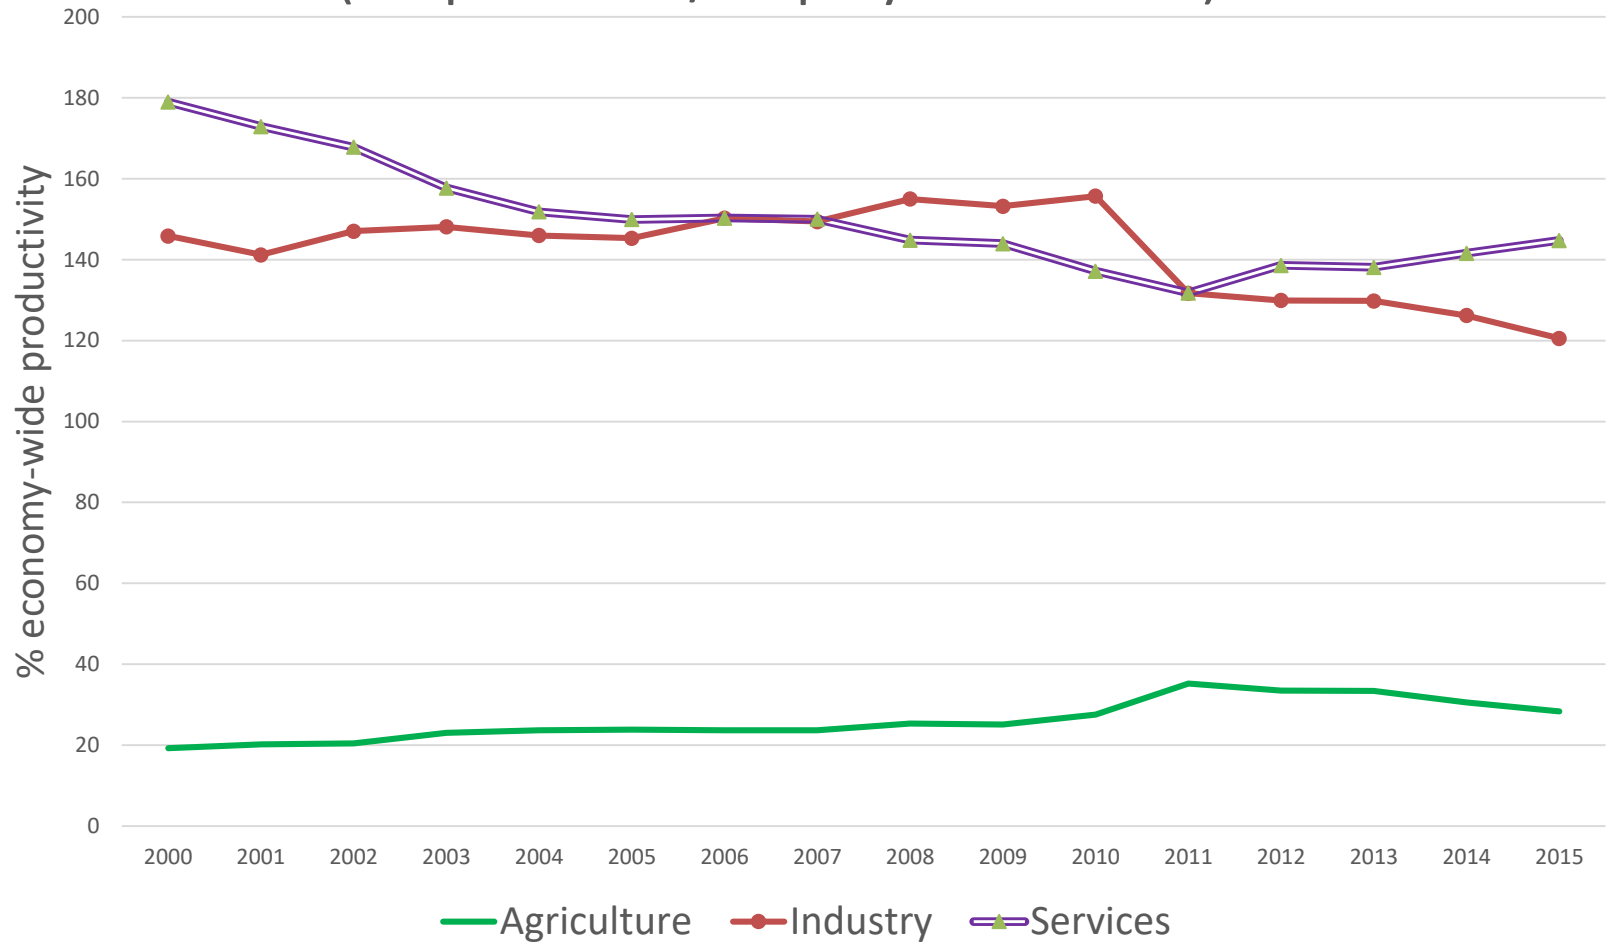

IQ of Grade 1 students
In 2016

Pink (45%) less than 100
In 35 provinces

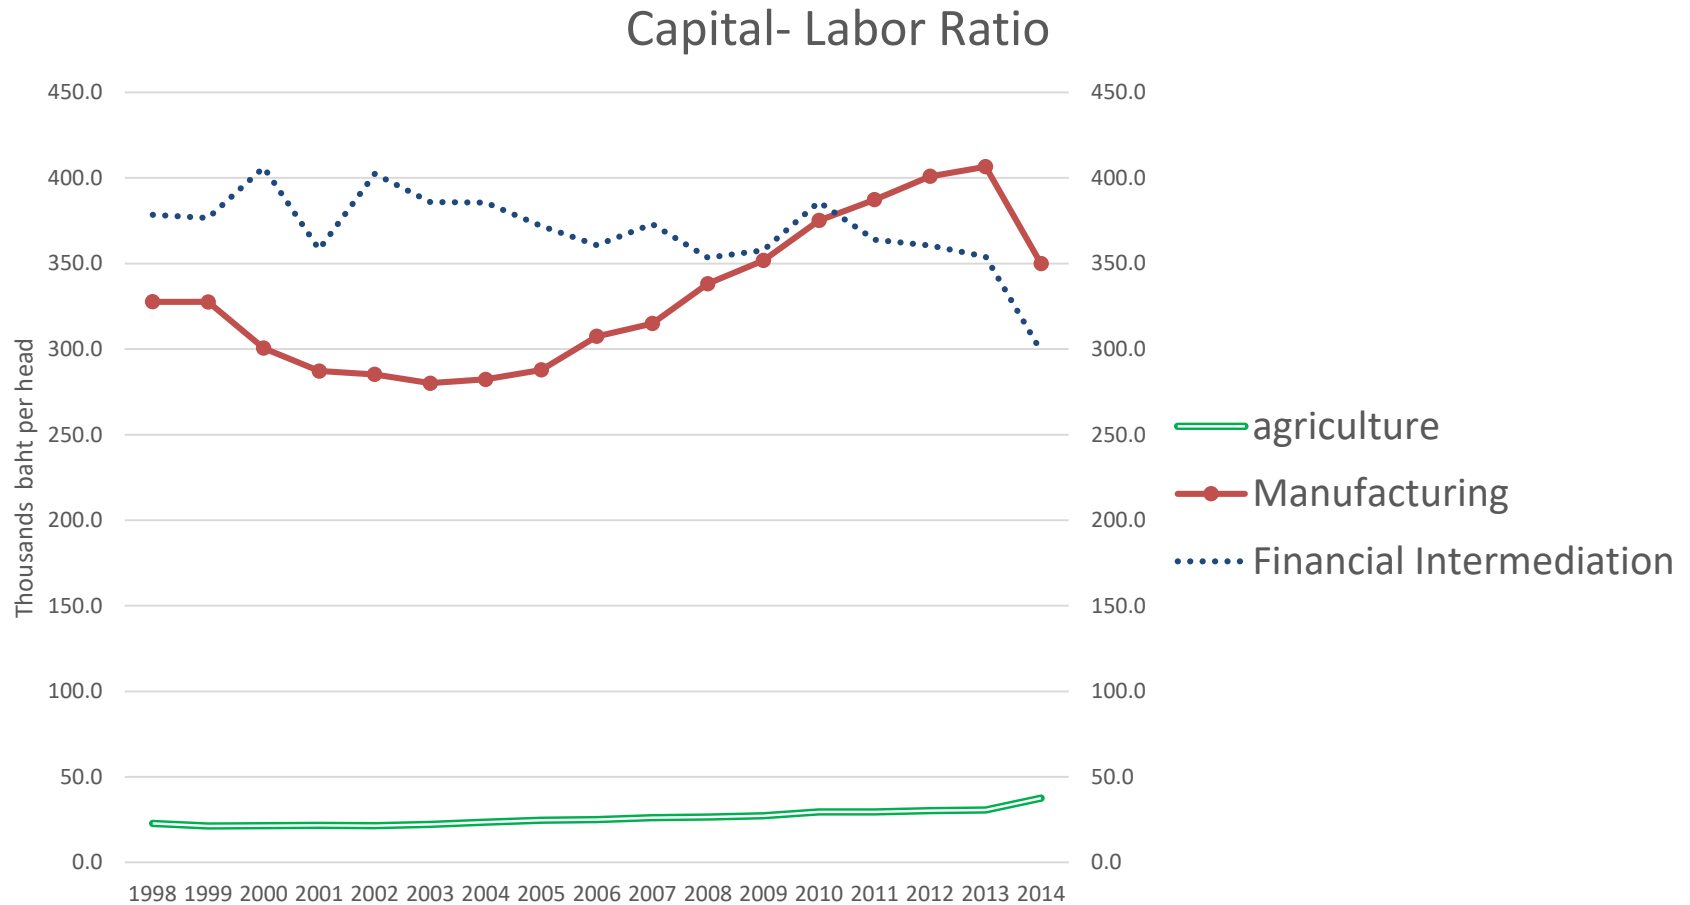

Yellow (39%) about 100
In 30 provinces

Green (16%) above 100
In 12 provinces

Relative sectoral labor productivity (output share/employment share)

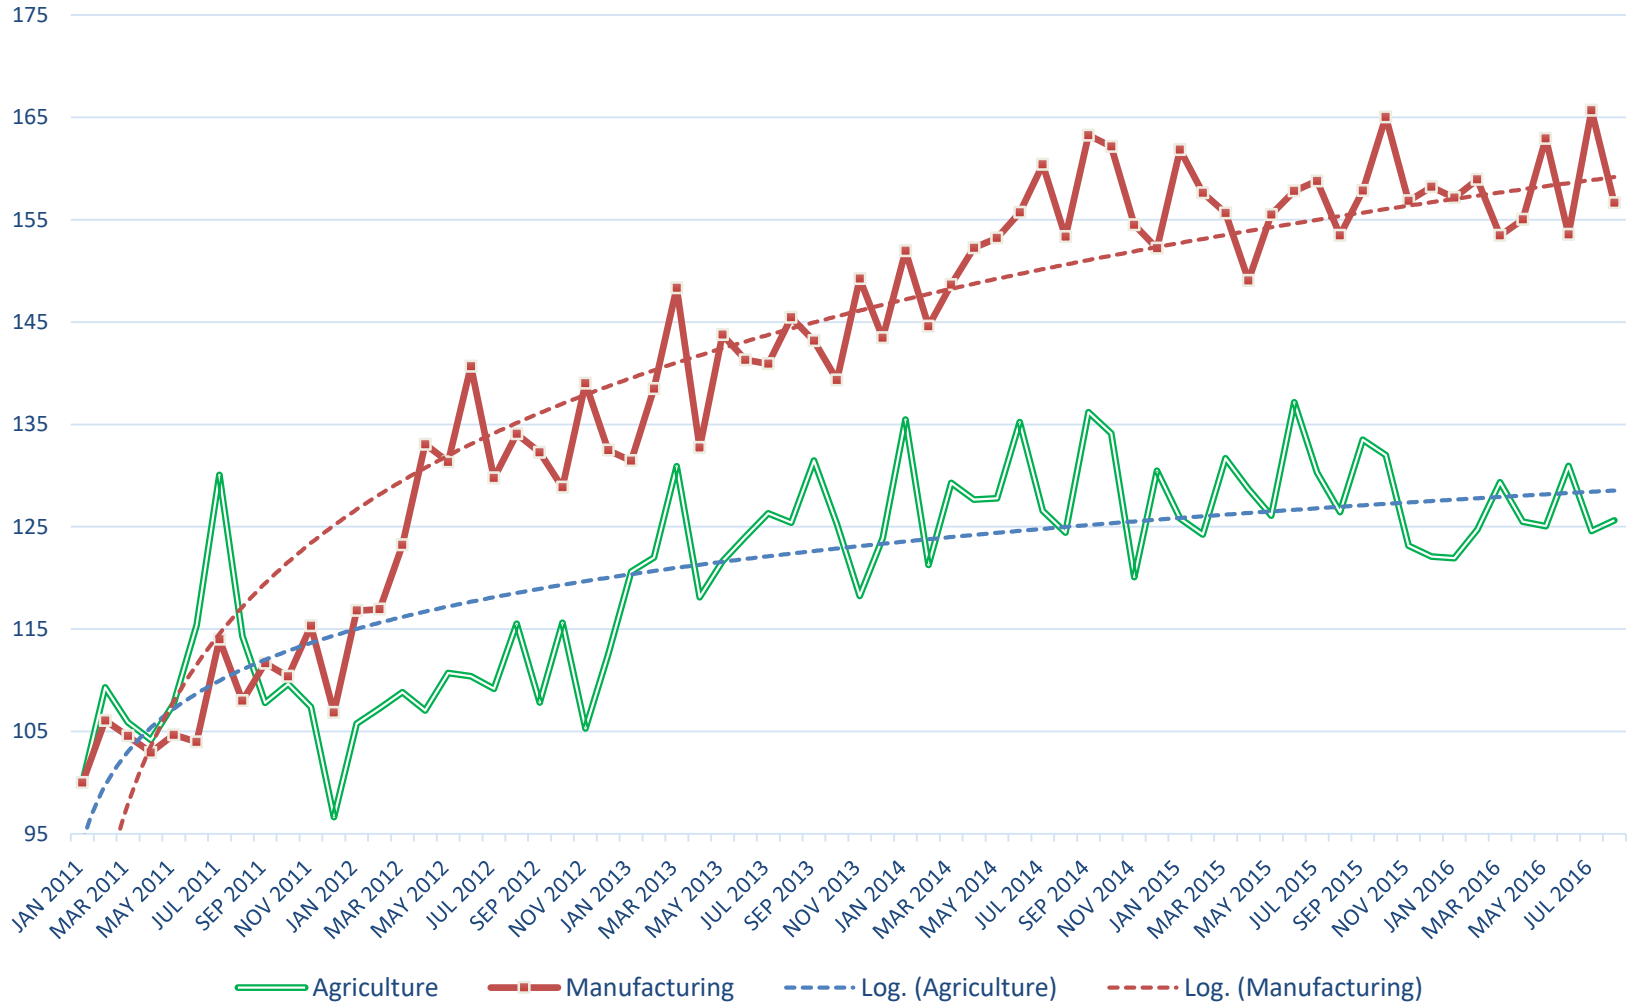

One of the great ratios in economics

Capital liberalization and income inequality

- **Capital liberalization led to capital concentration in the modern sector; thereby raising the capital-labor ratio in the manufacturing and non-traded sectors, including the FIRE (Finance, Insurance, Real Estates) sector.**
- **The agricultural sector is credit constrained with low level of capital accumulation.**
- **Productivity differentials grow together with wage differentials and income inequality.**

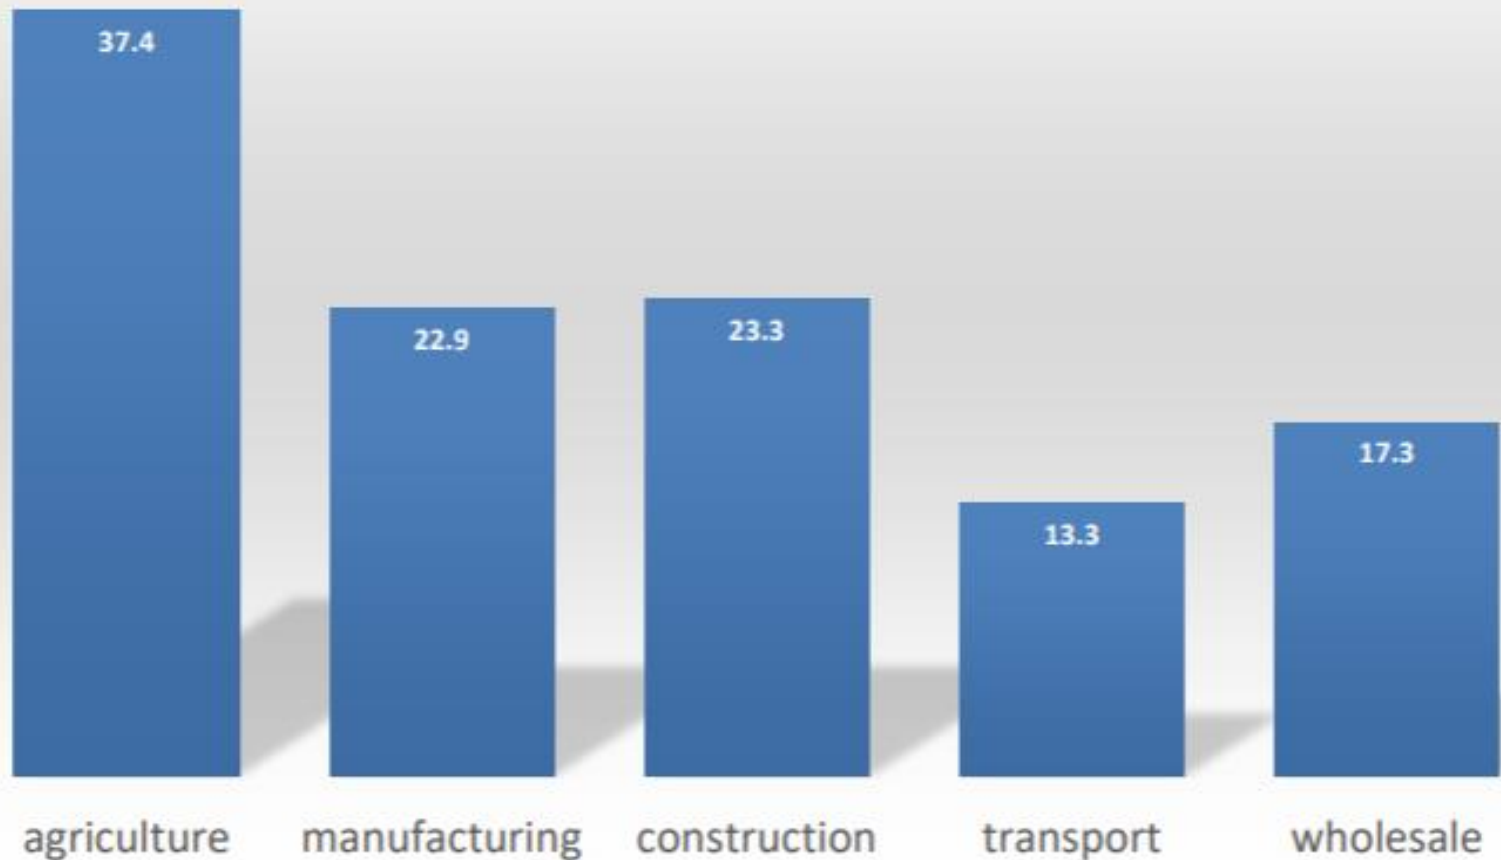

Widening Wage Gap

Underemployment

(percent of those underemployed by sector in 2011)

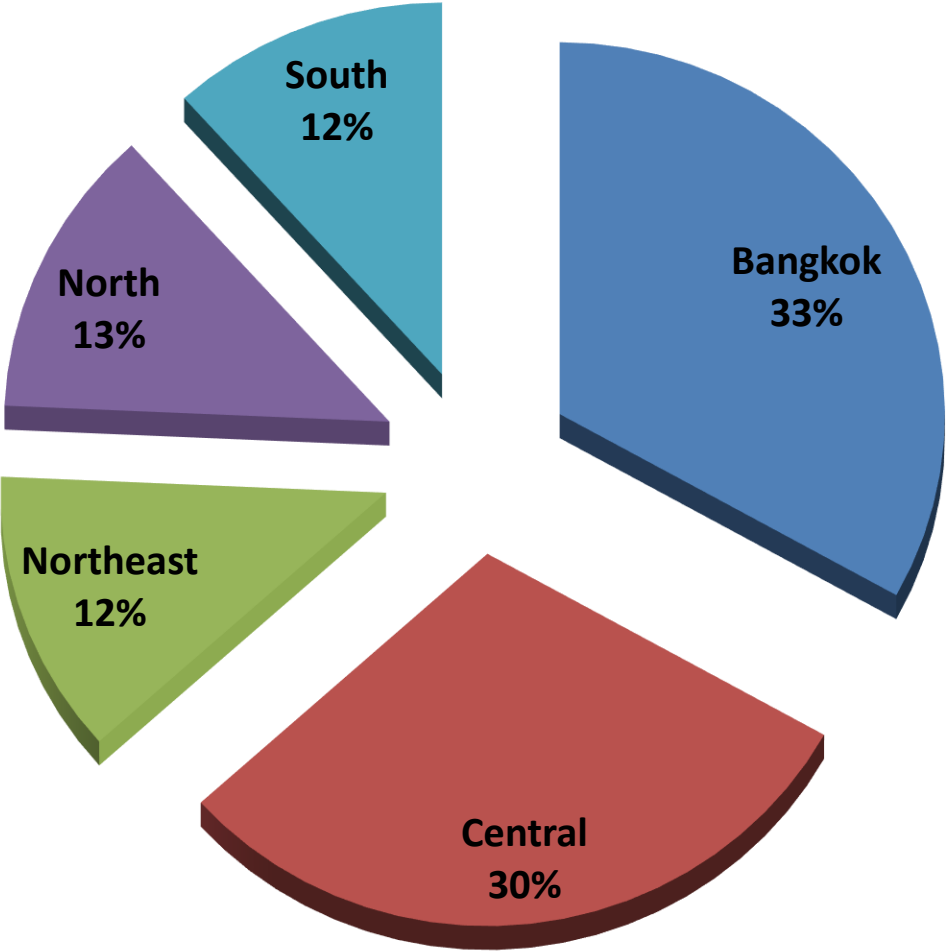

Definition: percentage of those who worked fewer than 34 hours a week

4. Financial inclusion: three important effects

- There is now a wealth of evidence from worldwide research that suggests financial inclusion plays a critically important role in ***poverty reduction, reducing income disparities and increasing economic growth.***
- The cumulative effect of a large group of population being effectively excluded from access to formal financial services carries both private and social costs, and ultimately undermines economic growth and development.
- The most important reason for being excluded appears to be either having incomplete documentation or lacking any collateral.

Financial Inclusion: Distribution of Bank Branches: January 2016

Summary

- Output growth of the service sector has more impact on poverty reduction than manufacturing and agricultural sectors.
- Capital liberalization led to rapid capital inflows, enhancing capital-labor ratio, and enlarging productivity differentials.
- When the terms of trade turns against farm prices and agricultural productivity lags behind other sectors, income inequality deteriorates.
- There are some flaws in using the Gini coefficient to measure inequality.

Questions

- Explain how trade reform and capital control liberalization might affect income distribution.
- “Economic development in Thailand is a failure because income distribution has worsened” Discuss.
- What are major factors determining income distribution in Thailand?
- “A move toward free trade improves income distribution in Thailand” Discuss.
- Analyze the impact of oil price shocks and food price shocks on income distribution and poverty.
- What can Government Savings Bank and the Bank of Agriculture and Agricultural Cooperatives contribute to reduce income inequality?

Previous final exam questions

1. "Quantitative easing policy conducted in the US would exert a negative impact on Thai exports in 2011" State whether you agree or disagree with the statement. Provide brief reasons to support your answer.
2. "The Bank of Thailand raised its key policy rate to 2% last week. Other things equal, the normalization of monetary policy that would continue into next year can subdue inflation in 2011". State whether you agree or disagree with the statement. Provide brief reasons to support your answer.

Open-book exam
Each question carries 10 points

3. With substantial extension of mass-transit routes of trains to provinces surrounding Bangkok, How would the rent gradient of Bangkok look like in 2020?
4. Discuss whether a ban on rice exports by China would have any impact on poverty and income distribution in Thailand.

Answer all questions

5. If Burma and Laos are accepted as a member of the WTO in 2025, how would Thailand's pattern of trade be affected?
6. If the government does not cut public consumption in the next fiscal year, the budget deficit will be worsen and raise the debt-to-GDP ratio further.

Make sure that your answers are as clear and concise as possible

7. Thailand was able to recover within a few years after the bailout by the IMF during the financial crisis in 1998. Do you envisage any similar pattern of recovery of the Greek economy in the near future?
8. Examine how Thai industries, poverty, and income distribution can be affected by:
 - (a) the baht appreciates to 27 baht to the dollar by the end of the year
 - (b) the depreciation of the baht to 40 baht by the end of the year
 - (c) The daily minimum wage is raised to 356 baht.
